Bullion.—We collate from our files and other sources the total bullion shipment for August. It will be seen that the figures are positively immense. Following are the shipments of the several companies: Richmond Company, 981,420 pounds; Eureka Consolidated Company, 860,683 pounds; Ruby Consolidated Company, 440,589 pounds; K. K. Con. Company, 150,000 pounds. Grand total, 2,432,592.

Phœnix.—The deepest shaft in the district is that of the Phœnix Company. It is now down something over five hundred feet, and the work of sinking continues. A quartzite formation, carrying much iron, has been encountered for the last two hundred feet, though a change has lately taken place. Granite is now coming in. It is our opinion that the ore channel is to the northward of present operations.

Messrs. Benedict & Prescott are the lessees of the Jackson Furnace, and since they commenced operations, one week ago yesterday, they have made a very successful run. They informed us that they yesterday paid out $3,000 for help and material; all of which adds to the general prosperity of the town. It is their intention to keep the Jackson in full blast as long as they can get ore to run on.

REESE RIVER DISTRICT.

Chase Mine.—Reese River *Reveille*, Sept. 5: The Chase mine, in New York Cañon, which has been lying idle for some time past, has been leased by a company consisting of Messrs. Kling, Ford, Reynolds, Conley and Barrett, who commenced work last Monday. It is the intention to put up machinery and thoroughly prospect the mine. A large amount of money has been taken out of this mine, hitherto, and there is every reason to suppose that it still contains bodies of paying ore. We wish the new company sucess.

Belmont Company.—*Reveille*, Sept. 13th: The Belmont Company are pushing the lower levels both north and south. Considerable very rich ore is taken from the drifts as the work progresses. The work is nearly all done by contract. A new steam pump is on the way for the Highbridge shaft. As soon as it arrives it will be placed at the bottom of the shaft and the work will again go ahead.

Monitor Company.—Are still sinking their large vertical shaft, south of the old works; said shaft has already attained a depth of 70 feet and the work progressing at the rate of about two feet per day.

El Dorado North Company.—Have just completed their drift from the main shaft 90 feet, have cut through the ledge and to-morrow will start the south level, following the main vein to the line of the El Dorado south. The ledge, where cut through in the El Dorado North, has the same characteristics as the El Dorado South. The quartz and vein matter are the same. The granite foot and slate hanging walls are the best evidences of a true fissure vein that we could wish for—hence the confidence maintained in this mineral belt.

El Dorado South Company.—Have ceased sinking their main incline for the present. New levels, about 80 feet below 400-foot level have just been started and when these levels each the ore bodies, both north and south, we shall expect to hear big reports. Stoping is still going on above the 400-foot levels.

Bolivia.—Judge McKenney, who has just returned from his copper mines at Bolivia district, informs us that a ledge has been struck in his mine which he considers a true fissure. He forwarded one car load of ore to San Francisco and one to Dayton. That shipped to San Francisco, although it assayed up to a good percentage, did not go as high as he had expected; from the car load shipped to Dayton no returns have yet been received. From the tests made, the Judge is satisfied he has a good thing and is steadily continuing the work of developing his mine.

Mills.—The El Dorado and Belmont-Monitor mills are kept running steadily and turning out their regular quantity of bullion.

ROBINSON DISTRICT.

Hayes Mining Co.—White Pine *News*, Sept. 20: From a sample taken from the 200 ft. level, the assay went $436 in gold and $180 in silver, making an aggregate of $616 per ton, the second, at the same depth, resulted in $180 gold and $125 silver, or an aggregate of $305; the third, at same depth, $194 silver and $100 gold, or $294 total. To illustrate the increased value of the ores as depth is attained, we find a sample showing at 110 ft. by assay, $131 gold and $47 13 silver.

Watson G. & S. M. Co.—This company's mill started up on rock from their own mines on Monday last. We understand that everything in and about the mill is in most excellent condition, and success in crushing is now a certainty. As soon as the present run is finished, ores from the Hayes Company's mines will be worked on contract now made. The people of that section seem fully to realize the importance to be attached to this enterprise, as through its successful operation has depended the future of the camp.

WASHOE DISTRICT.

Belcher.—Gold Hill *News*, Sept. 27: Daily yield, 350 tons of ore. The incline is down 96 ft. below the 1300-ft. level, the sinking making fair progress, although the rock continues to blast quite hard. The main south drift on the 3100-ft. level is in 870 ft. from the south line of the Crown Point, the face still in good ore. The winze from the 1300 to the 1400-ft. level is down 90 ft., and still in fine ore. The winze from the 1200 to the 1300 ft. levels is down 51 ft., also in good ore. The different ore breasts throughout the mine are all looking and yielding splendidly as usual. Since the fire in the Woonville.—Sinking the new shaft east of the cañon is making good progress, the rock in the bottom blasting well. The repairs to the incline are completed and hoisting ore again resumed. The main drift at the second station is looking finely.

Buckeye.—The ore bodies at the first, second and fourth stations are developing finely. There is ore enough already in sight, of a good quality, to keep the mill running for the next six months. The ore works $14 per ton at the mill.

Savage.—Sinking the incline is making good progress, the rock in the bottom blasting finely. There is nothing new to report of the prospecting operations on the different levels.

Dayton.—The body of ore found in the main

The Great Tuolumne Canon.

At the last meeting of the California Academy of Sciences, R. E. C. Stearns read a paper entitled, "Remarks on the Upper Tuolumne Cañon," which, as it contains matter of general interest, we produce in fnll. Mr. Stearns said:

"Recent numbers of the *Overland Monthly* have contained contribntions by Mr. John Muir, descriptive of the npper valley of the Tuolumne, and that portion of said valley known as the Hetch-Hetchy.

It is gratifying to know that Mr. Mnir has found the valley not difficult of access, thongh at one time supposed to be so, after a partial effort made from an inaccessible point, by Mr. Clarence King.

In the above publication for August last, Mr. Muir says: "Sometime in August, in the year 1869, in following the river three or four miles below the Soda Springs, I obtained a partial view of the Great Tuolumne Cañon before I had heard of its existence. The following winter I read what the State Geologist wrote concerning it." He here quotes from Prof. Whitney as follows:

"The river enters a cañon which is abont twenty miles long, and probably inaccessihle through its entire length. * * * It certainly cannot be entered from its head. Mr. King followed this cañon down as far as he could, to where the river precipitated itself down in a grand fall over a mass of rock so rounded on the edge that it was impossible for him to approach near enough to look over. Where the cañon opens ont again twenty miles below, so as to be accessible, a remarkable counterpart to Yosemite is found, called the Hetch-Hetchy Valley. * * * Between this and Soda Springs there is a descent in the river of 4,500 feet, and what grand watsr-falls and stupendous scenery there may be here it is not easy to say. * * * Adventurous climbers * * * * should try to penetrate into this unknown gorge, which perbaps may admit of being entered through some of the side cañous coming in from the north."

Mr. Muir here resmes: "Since that time I have entered the Great Csñon from the north by three different side cañons, and have passed through from end to end, entering at the Hetch-Hetchy Valley and coming out at the Big Meadows below the Soda Springs, without encountering any extraordinary difficulties. I am sure that it may be entered at more than fifty different points along the walls by mountaineers of ordinary nerve and skill. At the head it is easily accessible on both sides."

I do not intend to question the motive or the taste of Muir's remarks, which might be regarded as a commentary npon his quotation from the State Geologist, or to explain why Mr. King did not explore the valley *at the time* referred to. It seems to me reasonable to suppose that upon the line pursued by Mr. King, the valley *was* inaccessible, and it is unreasonable to suppose that if an experienced mountain-climber like Mr. King had really desired to enter the valley he would have been deterred from doing so by obstacles of an ordinary character, as no person can with truth deny to him the possession "of ordinary nerve and skill."

This interesting region has heen again visited this summer by Mr. Muir and several other persons, and will soon become familiar to an increasing mumber of tonrists, from year to year.

On pages 428-9 of Volnme I (Geology), in his "Report of progress and synopsis of the Fieldwork," of the Geological Snrvey, "from 1860 to 1864," Prof. Whitney in commenting on the msin geological and topographical features of this region, remarks: "Tbe vicinity of Soda Springs and, indeed, the whole region abont the head of the Upper Tuolumne, is oue of the finest in the State for studying the traces of the ancient glacier system of the Sierra Nevada. The valleys of both the forks * * * * * exhibit abundant evideuces of having, at no very remote period, beeu filled with an immense body of moving ice, which has everywhere rounded aud polished the surface of the rocks, up to the hight of at least a thousand feet above the present level of the river at Soda Springs. This polish extends over a vast area, and is so perfect that the surface is often seen from a distance to glitter with the light reflected from it as from a mirror. Not only have we these evidences of the former existence of glaciers, hut all the phenomena of the moraines—lateral, medial and terminal—are here displayed on the grandest scale."

In a foot-note on page 429, Prof. Whitney says: "These glacial markings were *first noticed* by Mr. J. E. Clayton, and the fact of their existence was communicated by him to the California Academy of Natural Sciences, *several years ago*." (The italics are mine.)

At a meeting of this Academy, held on the 21st of October, 1867, [Vide Proc. Cal. Acad. Sci., Vol. III, page 368; see also *Evening Bulletin* of October 22d, 1867.] Profsssor Whitney exhibited some photograpbs and stereographs, taken for the Geological Survey by Mr. W. Harris in the Upper Tuolumne Valley, near Soda Springs, Mount Dana, Mount Hoffman and Mount Lyell. He also presented the following account of a remarkable portion of the Tuolumne Valley, which forms almost an exact counterpart of the Yosemite. It is by Mr. C. F. Hoffman, the head of a party of the Geological Survey, by which it was explored last summer.

Notes on Helch-Hetchy Valley.

Tuolumne Valley, or Hetch-Hetchy, as it is called by the Indians, is situated on Tuolumne Rivsr, about 15 miles in a straight line below Tuolumne Meadows and Soda Springs, and about 12 miles north of Yosemits Valley. Its elevation above the sea is from 3,800 to 3,900 feet, a little less than that of Yosemite. The valley is three miles long, rnnning nearly east and west, with but little fall in this distance. Near its center it is cut in two by a low spur of shelving granite coming from the south. The lower part forms a large open meadow with excellent grass, one mile in length, and gradnally increasing from ten chains to a little over half a mile in width, and only timbered along the edges. The lower part of this meadow terminate in a very narrow cañon, the hills sloping down to the river at an angle of from 40° to 60°, only leaving a channel from six to ten feet wide; the river in the valley having an average width of about fifty feet. This is the principal cause of the overflow in spring time of the lower part of the valley, and probably also has given rise to the report of there being a large lake in the valley. Below this cañon is another small meadow, with a pond. The upper part of Hetch-Hetchy, east of the granite spur, forms a meadow one and three-fourths miles in length, varying from ten to thirty chains in width, well timbered aud affording good grazing. The scenery resembles very much that of the Yosemite, although the bluffs are not as bigh, nor do they extend ss far. On the north side of the valley, opposite the granite spur we first have a perpeudicnlar bluff, the top of which is 1,800 feet above the valley; the talus at the base is about five hundred feet above the valley, leaving a precipice of about 1,300 feet. In the spring, when the snows are melting, a large creek precipitates itself over the western part of tbis bluff. I was told that this fall is one of the grandest features of the valley, sending its spray all over its lower portion. It was dry, however, at the time of my visit. The fall is 1,000 feet perpendicular, after which it strikes the debris and loses itself among the rocks. About thirty chains further east we come to the Hetch-Hetchy fall; its hight above the valley is 1,700 feet. This fall is not perpendicular, although it appears so from the front, as may be seen from the photograph by Mr. Harris. It falls in a series of cascadss at an angle of about 70°. At the time of my visit the volume of water was much greater than that of Yosemite fall, and I was told that in the spring its roarings can be heard for miles.

Still further east we have two peaks, shaped very much like "The Three Brothers," in the Yosemite. Their hase forms a large, naked and sloping granite wall on the north side of the valley, broken hy two timbered shelves, which run horizontally the whole length of the wall. Up to the lower shelf or bend, about eight hundred feet high, the wall, which slopes at an angle of from 45° to 70°, is polished by glaciers, and probably these markings extend still higher up, as on entering the valley the trail followed back of and along a moraine for several miles, the hight of which was about 1,200 feet above the valley. The same polish shows itself in places all along the bluffs on both sides, and is particularly fine on the granite spur crossing the valley. There is no doubt that the laigest branch of the great glacier which originated near Mount Daua and Mount Lyell, made its way by Soda Springs to this valley. A singular feature of this valley is the total absence of talus or debris at the base of the bluffs, except at one place in front of the falls. Another remarkable rock, corresponding with Cathedral Rock in the Yosemite, stands on the south side of the valley, directly opposite Hetch-Hetchy fall; its hight is 2,270 feet above the valley. The photograph by Mr. Harris will give some idea of this rock.

At the upper end of the valley the river forks; one branch, nearly as large as the main river, coming from near Castle Peak, the main river itself from Soda Springs. About half a mile up the cañon the river forms some cascades, the highest being about 30 feet. The valley was first visited in 1850 hy Mr. Joseph Screech, a mountaineer of this region, who found it occupied by Indians. This gentleman informed me that up to a very recent date, this valley was disputed ground between the Pah Utah Indians from the Eastern slope and the Big Creek Indians from the Western slope of the Sierras; they had several fights in which the Pah Utahs proved victorious. The latter still visit the valley every fall to gather acorns, which abound in this locality. Here I may also mention that the Indians speak of a lske of salt water on their trail from here to Castle Peak. Mr. Screech also informed me of the existence of a fall about 100 feet high, on the Tnolumne River, about 4 miles below this valley, and which prevents fish from coming up higher. Tbe olimate is said to be milder in winter than that of Yosemite valley, as is also indicated by a large number of oaks and a great number of *Pinus Sabineana*. The principal tree of the valley is *Pinus Ponderosa*; besides this we have *P. Sabineana*, cedar, *Q. Sonomensis*, *Q. Crassipocula;* also poplar and cottonwood. The valley can be reached easily from Big Oak Flat by taking the regular Yosemite trail, hy Sprague's Ranch and Big Flume, as far as Mr. Hardin's Fence, between south and middle fork of Tuolumne river, about 18 miles from Big Oak Flat. Here the trail turns off to the left, going to Wade's Meadows or Big Meadows, sometimes called Reservoir Meadows, the distance being about seven miles. From Wade's Ranch the trail crosses the middle fork of Tuolumne and goes to the Hog Ranch, five miles; theuce up divide between the middle fork and main river about two milee to another little ranch called "The Cañon." From here the trail winds down through rocks for six miles to Tuolumne Cañon. This trail is well blazed, and was made by Mr. Screech and others for the purpose of driving sheep and cattle to the valley. The whole distance from Big Oak Flat is 38 miles.

Another trail, equally good, hut a little longer, leaves the Yosemite trail about half a mile beyond the crossing of the south fork, thence across the middle fork within about one and a half miles of the sonth fork, crossing, and follows up the divide between the middle fork and the main river, joining the first-named trail at the Hog Ranch.

Painting from Nature.

Art in some respects is non-progressive. It is inclined to follow one groove, repeating itself till repetition becomes irksome. Peter is content to paint as Paul did a hundred years beforc, and Silas, blind to the present, copies the dull, uncouth and smoke-colored productions of the artists of the middle ages. Doubtless this sort of thing has its advantages—it must be a sorry thing that has not, yet for many reasons a change is earnestly to be desired. There is no reason why art should not be progressive. Painting is as much a live principle as any other of the arts, and being so should surely keep pace with them in the grand march toward perfection. There are some sciences which indeed seem incapable of improvement. Some are still in the grub state, burrowing in darkness; some have got as far as the aurelia, giving indications of life, but unable to burst the barriers around them; others have succeeded in escaping from the chrysalis, hut still hankering for their prisons are undecided whether to return thereto or stretch their wings into the regions of sunshine.

Art should not be like these. It is true, that being an æsthetic principle it has little sympathy with the realism of the age. But it should reflect the phases of the age, nevertheless. There are scenes continually around us which are worthy the master's pencil—scenes indentified with the times—yet which are rarely or never transferred to canvas.

There is no necessity to return to the creations of the past for inspiration. It can be drawn from those of the present and in a more vivid and more tangible manner. There is a good deal of humbug about ancient art, and it is time it were exploded. A sort of traditiou has prevailed that to attain celebrity the student must devote a certain period of his life to copying the works of the old masters. As a sequence no man was considered fit to paint who had not served such an apprenticeship. The result of this absurdity is apparent in the productions of nearly every artist from the days of Reynolds to the present. Instead of fresh, free and original pictures, reflecting the individuality of the artist, we have works fashioned in the style of some school, and as strongly marred by faults as beautified by excellencies.

The word "school" is a compendious word, but it means nothing. A certain man several hundred years ago painted in a certain manner, he used umber in his shadows and formed the Bolognese school. Another man several hundred years later, employed a red pigment in his lights and founded the Venetian school. Other men subsequently established other schools, the main principles of which were the use of certain colors, forcing of effects and eccentricity of composition. The men who founded these schools were of course fine artists. They painted better than any artists of their time, made their names famous, opened large studios, received pupils and set the fashion in painting. They died, but their works remained, and being continually copied the names of their creators were at last canonized. The merit of their works became perfect, and he was deemed a heretic who would cast a critical stone at them. This feeling still remains, but is less positive than formerly, and in the course of a thousand years will probably be almost extinct. It will take this length of time undoubtedly, for the human mind is such that when once an error has become fashionable, it is exceedingly slow to cast the incubus aside. Perhaps the artists in the Old World will never be emancipated from this thraldom. Not at least till the great sources from whence they draw their inspiration have ceascd to exist. But with us it is otherwise. We are removed from the influences which surround them. We have before us nothing but the grand masterpieces of nature, which we are free to imitate untrammeled by the conventionalities of art. We can draw our inspiration from the same source as the great masters. They studied nature; and while confining themselves to her manifestations were truly great; but fashion, ignorance and eccentricity too often reduced their sublime conceptions to the verge of buffoonery.

Nature to be perfect must be simply and truthfully interpreted. No two mcn see the same scene alike. No two can transfer it equally on canvas. Hence the variety of styles among artists who draw their conceptions from nature. It is hard to define the color of any object under sunlight. In fact, it has no distinct color. Its tone is continually changing; its very appearance varying as the light fluctuates. Even where the light is steady, it is not easy to tell the color of an object. The face of a rock may look gray, but the nearest imitation on canvas fails to give the exact tint of the original. Herein painting from Nature differs from copying from pictures. A fairly experienced artist will have no difficulty in approximating pretty closely to the coloring of any picture, even one moderately sullied by time, moisture and the smoke of altar-tapers. He knows that blue and yellow were used in the greens, black and white in the grays, and umbers in the background. He matches the originals as nearly as possible; but if he fails has no occasion for despair. The picture is unlike Nature. Its tints are permanent. He can go day after day, and month after month, if he will, and work upon his subject, till he brings it to a reflex of the original. Not so with him who works from Nature. He has a thousand difficulties to contend against. Blinding sunshine, changing light, varying outlines, dust, fogs, winds, insects and reflections. It is one thing to sit quietly in a well-lighted room and copy a work which is unchangeable, another to squat upon the trunk of a tree under a blazing sun, endeavoring to catch effects which are every instant changing, while a host of flies buzz about your ears, and a snake—a rattlesnake may-hap—strikes his castanets within a few feet of your resting-place. One state is the genius of comfort—the other the acme of infelicity. The first presents attractions which might attract even a sybaritic nature. The last is rife with annoyances. Ay! dangers which might appal the most druidical of artists. Hence, perhaps, the comparative paucity of landscapes from Nature. None but the boldest and most enthusiastic brushmen venture to encounter the toils and perils of the wilderness. We speak of this country particularly, where out-door sketching is attended with difficulties, not found in more thickly-settled countries. Yet in England, that paradise of sketchers, Nature is not closely studied without discomfort; panthers range among the sketching-grounds of the Eastern painters, and the California artist may at any moment find his studies interrupted by the intrusion of some hungry plantigrade roaming through the thicket in search of a breakfast.

Yet, if sketching from Nature has its unpleasant phases, it is the surest road to distinction. It is, in fact, the only road a man can take who would justly portray the beauties of his art. Painting is simply a representation of Nature idealized. All men who have become eminent in art have drawn their conceptions from this grand original; and as Nature herself is unchangeable—the same to-day as she was a thousand years since—so their works are as true now as when first created. Being true they are as appreciable now as they were then, and will so continue till they have mouldered into nothingness. Hence we say, Paint from Nature. It is the quickest and noblest way to eminence. Let every man who feels he has the gift of art within him strike out for himself. Discard the fogy trumpery of the past and give new conceptions from the present. Be a living principle, not a fossil. The ancients have done enough for us, let us do something for the future. We have no lack of talent, and no want of Nature. All that is wanting is the energy to utilize these endowments. When this is done, our artists will open new roads toward their own preferment and inaugurate a new era in California art.

HECTOR A. STUART.

THE KROM CONCENTRATORS at Star Cañon, Nevada, still continue to work in a satisfactory manner both mechanically and pecuniarily. Another lot of concentrations has just been shipped from the mill to San Francisco. These concentrations average $1,000 per ton and represent in every 7½ tons, the metalic value of 104 tons of rock of the second and third grade from the De Soto Mine.

The superintendent of the mill writes under date of Sept. 13th, that the machinery is fnlfilling every expectation as regards capacity and durability, and that the steel rolls have not evsn been faced np. This fact is one of great interest considering the length of time and amount of work done, they having been put in operation in March last. It will be remembered that the ore is first crushed in a Blake crnsher and then put through these steel rolls instead of under stamps. The snperintendent also writes that in every case of trial npon the various kinds of ore bronght in for working, perfect success attended the working of the concentrator; "upon all classes of base and sulphuret ores the concentrations are perfect."

THE Shasta *Courier* states that Mr. I. B. Potter, in behalf of the Iron Mining Company recently organized in Sacramento, has secured the exteusive deposit of ore situated near the site of the old Silverthorn Bridge, on the McLoud River, in this county. He has purchased a portion of Silverthorn's road, and will soon commence taking out ore for shipment below. It is estimated that millions of tons of good paying ore can be taken from the snrface of the ground claimed by the company, and that the expense of taking it up from its original place of deposit will be very trifling. The Iron Company have done work enough on Iron Mountain, above Shasta, to entitle them to hold the ground and apply for a patent for mineral land, and it is their intention to do so. Tests show that the ore on Iron Monntain contains not only iron bnt also other valnable minerals—which establishes the fact that the ground is subject to entry under the Mineral Land Law exclnsively.

A SUIT FOR DAMAGES:—Alexander McLean has sued the Blue Point General Mining Company, Snoker Flat, for $40,000 damages. He avers that a blast was carelessly let off in the mine, about 300 feet from which he was at work, and a large rock was thrown against his arm, maiming him for life. McLean states that previous to the acoident the company ordered its employés engaged in setting off blaste to discontinue giving warning of explosion, as it caused loss of time and labor. If this be true, it was rather a singular proceeding that the company should lay itself liable for damages in this manner, by issuing any such orders.

Useful Information.

Conservation of Fruits.

Certain kinds of fruit cannot he kept during the winter; they change rapidly in contact with the air, and rot. It is well known, however, that apples and pears when placed without touching one another, on hoards in a dry place, may he kept during a whole winter. It is also known that most fruits, when boiled in a sugar solution and changed into the so-called conserves, or placed in brandy, are preserved by the power of the sugar or alcohol. But cherries, peaches, berries, grapes, etc., cannot he kept in the natural state; to treat them as apples or pears is useless—they change rapidly. Science has taught to preserve them against the action of the atmosphere hy placing them in a vacuum; and cherries have been kept for years in this way; but the method is not very practicable, and an efficacious practical way of preservation during winter has always been very desirable.

If the problem has not been solved for all kinds of fruits, it has at least been solved for grapes by an able French wine-grower, who has succeeded in preserving bunches of grapes until the month of April, when they were as beautiful, fresh, and savory as in October. He has kept his method secret for a long time, but recently concluded to give it publicity. He leaves the bunches attached to the vine as long as possible—until the end of October; or, if the weather permits, to the beginning of November. Before the first frost they are cut, with the precaution to leave attached to every bunch a piece of branch with four or five knots, of which two or three are to be below the grapes and two above. The upper end of the branch is closed by covering it with wax, so as to check the evaporation of the liquids contained in the pores. The imperfect grapes on the bunch are then carefully removed, and the lower end of the branch is placed in a bottle containing water, in which a few ounces of charcoal are present. The latter is the whole secret of the process, as it prevents the water from spoiling, keeping it fresh, and the grapes also. The bottle is closed with a good cork, cut in half and hollowed out so as to pass the branch of the bunch of grapes through, and the cork covered over with wax, when the whole operation is finished. The bottles are then placed on the shelves of a dry room, in a support which prevents them from falling by the weight of the bunch, and at proper distances so as not to touch one another. By this inexpensive method beautiful grapes may he kept till late in the winter, and even until the beginning of the spring; but it is necessary to examine the grapes from time to time, and cut those off which commence to spoil, as this appears to he contagious. The temperature of the room must never be allowed to descend below the freezing point. — *Manufacturer and Builder.*

How White Lead is Made.

The following is the process through which pig lead, as it is termed in the markets of the world, goes, before it assumes the desired appearance and properties of white lead, and to which it is subjected in all the leading manufactories of this article. The pig lead is thrown into a furnace, and afterward carried through a machine which cuts it into a shape closely resembling an ordinary buckle. Thence it is conveyed to the beds, which are composed of alternate layers of earthen pots about half full of the leaden buckles and corrosive acid, and covered over with planks, to render distinct the numerous strata of the heap, which usually rises to a hight ranging between twenty and thirty feet; and over all is thrown a complete covering of tan, a refuse matter obtained from tan-yards, or the odure of horses. This is called putting the lead to bed. Through the center of the dormitory runs a leaden steam pipe. In undisturbed repose the lead remains about two months. Then the coating of manure is shoveled off, and the pots are opened and found to be filled with a white substance resulting from the corrosion of the common pig lead. From the earthen pots the lead is now transferred to wooden pails and carried to an upper room, whence it passes through a shute to the screen room. Here it is subjected to the action of a series of rollers, ground fine, washed, and then pumped into large tanks, where it is allowed to remain a few hours to settle. Then it resumes its journey and flows into a room called the drying loft, heated to temperature of 150 degrees. Here, in the unnatural atmosphere, it is that the severest sufferings of the white lead workmen are endured. In this department the lead is spread on large tables, about fifty or sixty feet in breadth, where it remains for four or six days. It passes thence through the mixing process, and afterward to the white stones. Here it reaches the completed state, and is at once packed in kegs for transportation to any quarter of the globe. The whole air of these factories is impregnated with white lead, and even in the streets a square or two distant one can detect the noxious scent.

Furniture Oil.—Mix half a pint of olive oil with one pound of soft soap. Boil them well, and apply the mixture to your oiled furniture with a piece of dry cotton wool. Polish with a soft dry flannel.—*Journal of Chemistry.*

Lead Pencils.

The first, and still the most widely extended use of plumbago, was for making crayons or pencils. The original method of manufacture was very simple. The lumps of mineral were cut into the required shape and used in the natural state. At a later date it was sawed into the shape now used, and covered with wood, making the well known lead pencil; but the Borrowdale mine, in England, the best known, finally ceased to produce the mineral pure enough for the purpose, and that method was reluctantly abandoned. The refuse about the mine was then utilized by purifying and pressing into blocks, and these in turn were sawed into "pencil leads." But the leads made in this way were weak and unreliable, and even had they been useful the march of civilization required pencils of different grades, some soft and others harder, while the sawed leads were all alike. The present method consists in selecting the best granulated plumbago (found till recently only in Germany), pulverizing it finely, and floating it in water through a series of vats, the coarser particles settling to the bottom of the first vat, the finer in the next, and so on till after passing through several, that which settles in the last is considered fine enough for the purpose. A suitable clay is found, as yet only in Germany, and this is treated to the floating process, the finest only being fit for use. The plumbago and clay are then mixed together with water to the consistency of cream, and ground together like grinding paint. When this operation is completed, the mass is plastic, water enough having evaporated to leave it in that state. It is then put in a press and forced through an opening of the size desired for the pencil leads, and the leads are cut to a suitable length, straightened and dried. When they are dry enough to handle they are placed in a crucible, the air is excluded, and they are subjected to a high heat, which bakes them, and brings them out ready to be placed in the cedar for pencils. The different grades are produced by the different mixtures of clay and plumbago; the more clay, the harder the grade produced.

A Strong Adhesive Paste.—According to Fr. Sieburger, an excellent paste may be prepared as follows: Four parts, by weight, of glue are soaked for several hours in 15 parts of water, and then slowly warmed until a perfectly clear solution is formed. This solution is then diluted with 65 parts boiling water and thoroughly stirred. In the meantime 30 parts of starch are stirred into 200 parts of cold water, so as to form a thin, milky liquid, free from lumps. Into this is poured the solution of glue, stirring continually and heating. When cold, 10 drops of carbolic acid are added. The paste made in this way is said to possess extraordinary adhesive power, joining leather, paper, pasteboard, etc. By keeping it in closed vessels, so that the water cannot evaporate, it may be preserved for years. Where no great strength is desired, ordinary flour or starch paste is used, a little carbolic acid being added to prevent souring.

To Whiten Shells.—Boil the shells in weak lye for two or three hours, turn that off and boil in soapsuds, then put them into clean water and brush them with any old brush; they will be white and nice. Shells or cones are more durable put on with putty than with glue. For shells get white lead ground in oil, (it comes in boxes,) and put in a little whiting, about a tablespoonful to a pound of lead; it is whiter than common putty. For cones add a little lamp black.

Working Green Wood.—A correspondent of the *Scientific American* says: Some of my brother wood-workers may not know that the difficulty of finishing a small piece of green wood, as is some times necessary, may he overcome by scorching the piece after it is shaped out. A few lighted shavings will do, and you can then file and sandpaper without trouble.

A German inspector of passenger cars states that a single stem of hemp, with the leaves and blossoms, mixed with the stuffing of a car seat, will protect it from moths for years, and that hemp for this purpose should be gathered just when in blossom, dried rapidly in the shade, and kept in covered wooden vessels in a dry place.

Any one desirous of keeping seeds from the depredations of mice, can do so by mixing some pieces of camphor gum in with the seeds. Camphor placed in drawers or trunks will prevent mice from doing them injury. The little animal objects to the odor, and keeping a good distance from it, he will seek food elsewhere.

An electrical apparatus has lately been invented to signal the entry of water hy leakage into the holds of vessels. When the water enters, it establishes a current, and a communication is thus set in operation which gives notice to the officers on deck.

Petroleum is preferable to the fatty oils for cleaning weapons, especially gun barrels, as it does not become rancid and has greater solvent powers for dirt and grime.

Flexible Paints.—Yellow soap cut into slices, 1 1-2 lbs.; boiling water, 1 gall.; dissolve and mix while hot with oil paint 1 1-4 cwt. Used to paint canvas.

Good Health.

What We Should Sleep On.

One may imagine the internal impurity of a feather bed after it has been slept upon a month, a year; but five, ten, twenty years! That baffles imagination! The reeking secretions of, nobody knows how many, bodies, in some cases sick and dying bodies, are stowed away in these ticks, and when they are heated up by your kindly warmth, they come out and attack you with their countless little envenomed darts, just when you are least active, least able to resist them. Is not this reason enough why languor and headaches follow such a nights' rest? I always shudder when I get into a "hospitable" feather bed. Some housekeepers wash them every five years. I should want them washed every five weeks, and then not feel safe in them.

There is reason enough for discarding feather beds, but what shall we put in their place? Hair is elegant and comfortable, but very expensive, and it needs cleaning at least once a year; oftener, in fact, which is an additional expense. Clearly, everybody can't have hair. Straw, if often changed, is a good bed for those who work hard and sleep soundly, and delicate people sometimes put their feather bed under it, spread a thick comfortable over it, and find themselves far more refreshed than when sleeping on feathers. But husks are better still—not the coarse, soiled, mildewed article, but the inside husks, soft and clean. If we want the best bed we can make from them, we will wet, braid, and then dry them; then undoing, strip them with a fork or gauge, as we choose, or this can be done without braiding, which only curls them. A merry evening or two, with the children to help, will prepare enough for a bed. Put them into an open tick, so they may be readily aired; spread a comfortable over them, and you will have a bed scarcely inferior to the best hair mattress for comfort and durability. This material makes good pillows also, does nicely for children, who do not mind the slight rustling; but hair is still softer, and it costs no more than feathers.

For bedding, nothing excels the thick Whitney blanket. Comfortables next the sheet, like the feathers, entangle too much air. Even the blanket should be washed as often as once in three months. Use no more bedding than absolutely necessary; better wear flannel or Canton flannel nightdresses, and oven drawers, but never the same worn during the day. If the feet are liable to be cold, wash, rub, and dry thoroughly, and wrap them in a foot blanket. They must be kept warm at all hazards, if you wish for health. In cold weather, it is advisable to have a "foot comfort," coming half-way up the bed. A "day comfort" is also a useful addition to a bed, where one takes a nap in the day time. It may be made of old silk dresses, with bright ties. Failing some much convenience, persons often lie down in the day-time with little or nothing over them, and, of course, being less energetic than when awake, they cannot so successfully resist the tendency to take cold.—*Julia C., Health Reformer.*

French Experiments with Oatmeal.

We see by an article in *La France Medicale* that M. Dujardin Beaumitz has been experimenting with oatmeal as a food for young children. He made use of a jelly prepared hy soaking a tablespoouful of the meal in a glass of water for twelve hours, then straining through a sieve, boiling till the whole assumes the consistency of jelly, and adding sugar or salt to taste. According to analysis, 100 grammes of the meal contain 8.7 grammes of water, 7.5 of fatty matters, 62.5 of starch, 12.2 of nitrogenous matters, 1.5 of mineral substances, and 7.6 of cellulose, dextrine and loss. Its nutritious value, therefore, as food for children, in regard to nitrogenous or plastic elements, as such as are respiratory, is analagous to that of human milk or cow's milk. Besides these, it contains more iron than do most of the articles of food.

Four newly-born infants were fed with the preparation just described, and in every case with satisfactory results. In addition to its qualities as food, it acts efficiently against colic and diarhœa. It enters into the composition of the syrup of Lnther, which is said to he much used in Germany. M. Gillette, surgeon of the hospital of Melun, has also given oatmeal combined with cow's milk to six children, and finds it to be a valuable food in cases where the natural supply of milk is deficient.

The late Dr. Marahall Hall, of England, said: "If I were seriously ill of consumption I would live out doors day and night, except in rainy weather or midwinter; then I would sleep in an unplastered log house. Physic has no nutriment, gasping for air cannot cure you, monkey capers in a gymnasium cannot cure you, and stimulants cannot cure. What consumptives want is air, not physic—pure air, not medicated air—plenty of meat and bread.

Nitrate of Amyle.—This is one of the new numerous products of coal-tar, and a few drops on the handkerchief will, when inhaled, prevent epileptic fits, and relieve asthma.—*Manf. and Builder.*

Domestic Economy.

Orangeade.—Impregnate a few lumps of loaf sugar with oil of orange, by rubbing into them as much as you can readily from the rind of four oranges. Roll as many oranges as you design to use, squeeze the juice, allowing eight to one quart of water. Throw the skins into a half-pint of water as you squeeze them, letting them stand a little while, then press them a little, and add this water to the other juice. The very highest flavored oranges should he selected, and if not found sour enough to impart an agreeable acid, lemon juice may be added, with the caution that it must not he used freely enough to impair the distinct flavor of the orange, which is meant to predominate. The oil should only be slightly rubbed from the oranges. Allow half a pound of sugar to the quart of orangeade, but in this matter consult, if possible, the taste of some experienced dessert maker. With all care to give an exact recipe, the proportions of both sugar and water may require modifying—a little more or less, as the case may be.

Starching and Ironing.—Starch and iron shirt bosoms as usual, and when the articles are thoroughly dry, place one at a time on a narrow, hard and very smooth board, which has one thickness of cotton cloth over it, sewed tightly; have the "polishing iron" heated so that it will not scorch, and rub it quickly and hard over the surface, up and down the bosom, using only the rounded part on the front of the iron. A still higher polish may be obtained by passing a damp cloth lightly over the smooth surface, and then rubbing hard and quickly with the hot iron. It needs a good deal of patient practice to do this admirably, but it is crowned with success, and when once learned is as easy as other ironing. A "polishing iron" is small and highly polished, with a rounded part which allows all the friction to come on a small part at one time, which develops the gloss that may be in both linen and starch. These irons may be had for about seventy-five cents each; one is sufficient for a family. Collars and cuffs look nicely done in this way.

A New Way to Serve up Peaches.—Take good-sized freestone peaches, wipe them with a towel, halve them, and place them flat side down in hot butter or lard. Let them fry to a nice brown, then turn and fill the seed-cup with sugar, which by the time the fruit is properly coated will be melted and form with the juice of the peach a rich syrup. Serve up hot, and if you don't like them you need not repeat the experiment. Most persons think the dish a superb one. Medical writers caution people against eating peaches served up in any form in the evening. It is asserted that they are depressive to the circulation, and exhaust the system hy the prussic acid which they contain. It is better to eat them in the morning, or not later than an early dinner, so that some exercise may follow eating to aid their proper digestion.—*Ohio Farmer.*

Almond Blanc-mange.—One gallon of cream. Soften in a small portion of this cream (cold) two ounces of isinglass. Have ready blanched two pounds of sweet almonds, with two dozen and a half peach kernels or bitter almonds. Beat these fine in a mortar, with a little rose-water to prevent their oiling. Put the gallon of cream with the melting isinglass into a preserving kettle over the fire, and stir until perfectly dissolved, adding meanwhile one pound and a quarter of white sugar. Let the cream come to a boil. Stir in the almonds smoothly just as you take the blanc-mange from the fire; set aside in a bowl to cool, stirring occasionally until luke-warm, when pour into moulds previously dipped in cold water.

How to Cook a Beefsteak.—A cotemporary says:—Put a frying pan on the stove, heat it quite hot; in this put the beefsteak previously pounded; allow the steak to merely glaze over, and then turn it over quickly to the other side, and thus turn it several times in the same manner, until it is done, which it will be in four or five minutes. Then lay it on a platter, previously warmed, and butter and salt it and set in the hot oven for a few minutes, when it is ready for the table.

If people must have their steaks fried, this is doubtless as good a way as any. For our own part, we prefer steaks broiled, fresh, crisp and juicy.

Delicious Food.—No part of any animal used for food is more delicious to many people than the brain when well cooked. It may be fried in butter, boiled in milk, and then placed in vinegar, or boiled in water two or three minutes, then heaten fine, mingled with sage salt, yolk of an egg, a gill of cream and fried in the form of drop cakes in butter. Before cooking it should be carefully washed.

Apple Jelly.—Apples make an excellent jelly. The process is as follows: They are pared, quartered and the core completely removed, and put into an oven or over a fire. When pretty well stewed the juice is to be squeezed out through a cloth, to which a little white of an egg is added, and then the sugar. Skim it previous to boiling, then reduce it to a proper consistency, and an excellent jelly will be the product.

MINING AND SCIENTIFIC PRESS.

Horticultural Society.

The Bay District Horticultural Society of California opened its antnmnal fair on Tnesday evening last. The display of flowers and fruite ie. as usnal with this society, highly meritorione and to a reasonable extent appreciated by onr citizens. Throngs of visitors are in attendance every day and evening to enjoy the pleasing scene and listen to the volnptnons straine of music from the band, as it floats throngh the mazes of beautiful tropical and other shrubs, plante and flowers, that adorn by their artistic arrangement the whole lower floor of the spacions pavilion. Our citizens should give it a generous and cordial support by their willing presence.

By a cave in the Brandy City mine near North San Juan, Nevada conuty, a few days ago, two men named Stevene and McIntyre were entombed twenty-three hours and a half. Some forty men worked like Trojans from the moment of the cave nntil the prieoners were rescned. At first continued caving drove the men from the work, and it wae only after running a carefully timbered drift sixty feet that the entombed men were reached. They were unhurt, but very weak.

The cave fnll of ore, found in the Fuller mine, owned by the Toledo and Utah Mining Co., is creating conciderable excitement in Utah. At the hottom of the main incline in the shaft, 250 feet from the surface, a cave was broken into, the dimensions of which are, ae far ae prospected, 110 feet in length, and from 3 to 12 feet wide, and from 20 to 50 feet in hight. Ore has fallen from the foot-walls and heen deposited in hnge maeee in the bottom of the cave.

The firet dividend of the Central Pacific Railroad Company, of three per cent. on its capital etock, has heen declared.

The Possibility of Flying.

The attention of the world is again turned to aerial navigation hy the Wise experiment in ballooning. For centnriee inventore have racked their hrains in vain in the attempt to solve the prohlem: How to fly. And even in pre-historic timee, if we take the mythological account of the trip made by Dædalus and Icarus, the qneetion commanded the attention of men. After emulating the fish in its element, it certainly seemed hard tbat they were still surpassed by the hird in its proper domain.

The devices for flying put forward up to the preseut, each thought by its inventor infallible, may be hroadly divided into two classee: self-supporting machines and those in which the halloon ie an auxiliary. Among the former was the attempt to fly by simply attaching wings to the arme; of conrse a failure. And no more successful wae the apparatus, in which a man the expected to riee in the air by hringing into nse, besides, the greater power of the leg muscles, on the principle of the oarsman's eliding seat. Man's unaided strength is too small, it had to be admitted, in comparison with his weight, to afford the least hope of succeee in thie direction. On the failure of this plan, inventors naturally turned their minds to other forces, in search of an adequate motor. Steam has been tried, hnt the same objection holds as hefore. The weight in any existing engine, together with the weight of fuel and water necessary, is dieproportionate to the power developed.

As an example of the second class of proposed aerial ships, there is the adaptation of propeller screws to elongated balloone, to be worked either hy hand or by steam. The difficulty here experienced is that the power attainable is not sufficient to overcome the resistance of euch a vast surface in the balloon as ie necessary to give the reqnired support. Hence all snch inventions have heen qnite as much at the mercy of the winds as the simple balloon.

Latterly, research has been directed to the posibility of utilizing the varying directione of air currents at different elevatione. Theee are known to be independent of each other. Could their laws he once mastered, it would only be neceesary to throw overhoard ballast and rise to a higher, or let out gas and sink to a lower, cnrrent, when the aeronant desired to change his course.

On the belief that there exists an upper current setting permanently eastward, Wise and Donaldeon base their faith. Experiment and obeervation wonld seem to bear them ont, in this theory, and the proposed further, hazardoue experiment is designed to test its truth. Ae yet, however, the conditions of npper atmospheric movement are too little known to render possible any systematic guidance of balloons.

The questions theu arise: Will aerial navigation ever he made practicable; that is, safe, snre and speedy? And in what way will thie end be accomplished? It ie no longer thought visionary to affirm a belief that flying is possihle. Sooner or later the problem, not so difficult by far as many already solved, will yield to the incessant efforts made to master it. The precise form of the air-ship of the future is, of course, a matter of mere speculation. It is safe, however, to exclude the mixed system as too bnlky, cumbrous and nnmanageable. We have left, ae modes from which to choose, the flying machine *per se*, in its original simplicity, and the ntilization of air currents for balloon travel. There ie no donbt but that the former method, if poseible, would be preferable. If a machine capahle of flying were once made, fly it could and must nnder all conditions of wind and weather. It would be comparatively independent of ordinary atmospheric change. As the fish is the model to he copied in water, so, probably, ie the hird in air. Plans so far made have been from two leading types,—machines having wings alone, or wings to support and propeller to drive. There is no force known at preeent which can be generated in sufficient quantity in proportion to the weight of apparatus neceseary. But it is only reasoning from analogy to argue that as great as has been the advance in mechanical contrivancee heretofore, so great will be the progress in future. Certainly the steam engine of to-day would he no easier of conception in the minds of the anciente, than an engine, of whatever kind, which shall be suitable for a flying machine, is to us. We have seen too many startling improvements of late to doubt the poesihility of still greater. The problem of flying ie apparently much easier than, for instance, that of transmitting intelligence thoueands of miles in an instant of time.

It is generally admitted that we shall soou see a revolntion in prime motors. The steam engine, as constructed, is one of the moet wasteful appliances imaginahle. It loses, we are told, some eighty per cent. of power which ehould be obtained from fuel, as calculated from heat nnits. Already many other forces are competing with that resulting from the expansibility of steam, some of which may supersede it. Electricity ie as yet anything but a practical motive power; but there is no reaeon why it should not he made one. Model electrical engines work to perfection; and in time electricity may he a veritable and cheap motor, applied on a large scale. Then there is the hot air engine, which needs no weight of water. So that we will not be limited to steam as the power for flying machines. Bnt even were such the case, important improvements might be made, in leseening dead weight. Fnel might be used which ehould he more effective with less bulk, thus relieving the air ship of much incumbrance. For certain parts of the machinery aluminum might be substituted for iron or eteel, thus again gaining in lightness. Many such modifications suggest themselves.

A Good Run.

Last February the South Anrora Mill, White Pine, started up on a run of 6,000 tons of ore for the Eberhardt & Aurora Company, and the work hae heen completed. The Superintendent of the mill has furnished the White Pine *News* with the following statement, showing the result:

The total quautity worked was 6,046½ tons, the average aeeay value of wbich was $56.78 per ton. Total assay value, $343,357.26. Actual value of bullion produced and depoeited, $298,892.82. This result showe the ore to have been worked np to 87 per cent. of the aseay valne. The average number of tons worked per day wae 37.8—the mill carrying 30 stamps. The loss of quicksilver wae hut 1.77 pounds per ton. The ore was fnrnished entirely from the North Aurora mine, nnder the superintendence of Capt. Frank Drake. Although the ore was remarkably free chloride, containing but a small per cent. of hase matter, still the yield is acknowledged to have equalled, if not excelled, any which hae ever been made on the same claee of ores produced in the mines of Treasure Hill.

The mill company guaranteed 82½ per cent. of assay value, and ae the yield wae about five per cent. ahove this, the mill owners made $20,000 over and above the milling price of $13 per ton. As they received $78,598 for the milling work, they got altogether upwards of $98,000 for the whole job. The *News* thinks that perhaps it ie due to the encouragement given to the Eberhardt & Aurora compeny, that they have determined to rebuild the mill bnrned laet year. It ie expected that thie mill —30 stamps—will etart np on the first of next month. It now looks as though White Pine, notwithetanding ite many reversee, would come out all right after all.

The Wyoming Mine.—We received thie week a very handeome specimen of ore from the Wyoming mine, Deer Creek, Nevada county, Cal. This mine was located as far back as 1851, and hae been conetantly worked ever since. The average net yield of thie mine in early days wae from $6 to $10 per day to the hand, bnt this was before improved appliances were in vogue and when there was no machinery of account in the mine. The *Transcript* thinks that with a good mill and all the moderu implements for raieing rock, the Wyoming can be made one of the best paying mines in the county. It has recently heen purchased hy a company in this city, who immediately erected hoisting works; the mine is being put in condition for thorough and systematic working to a depth of several hnndred feet. The *Transcript* of the 30th saye:

An incline shaft ie being sunk, which is already down fifty feet, carrying a fine ledge of sulphnreted ore, averaging fifteen inches wide. Water ie being brought from the Gentry tunnel hy a ditch, and boxes will be carried to a tank on the roof of the hoisting works, inenring protection and supplying the boiler. By next Monday the ditch will he completed, and the hoisting works will be etarted. The new proprietors of the Wyoming have started in well, and there is no reason to doubt that the mine will prove itself to he all that ite owners desire and that ere long it will repay them a hundred fold for their investment.

Security in Mines.

Since the last accident in the Yellow Jacket mine on the Comstock lode, people have commenced to think that the minee are subject to be blown up or catch fire at any time. At the Coroner's inquest, held after the late explocion, one of the miners testified that when in the employ of the Gould & Curry Company, upon eeveral occasione explosione occurred in the mine, caused by candles being brought in proximity to carhurreted hydrogen gas. Many think that the great calamity of 1869 wae from the same cause ae the late explosion. The Virginia *Chronicle* says that when we take into conaideration the fact that one of the explosions occurred on top at the old Yellow Jacket worke, 1,800 feet from where the fire was in the 1,300 foot level of the Jacket mine, we may imagine to what extent a mine may be filled with gaees. We add a portion of the verdict of the Coroner'e Jury, that our readers may judge for themeelves: "It is the unanimous conviction of the jury that the aboved named parties came to their death from asphyxia, cansed hy inhaling carhnreted hydrogen gas while in a state of combustion, together with other gases. We are aleo of the helief that the deadly gaees were generated by the fnmes of charcoal rising from the Crown Point and Belcher hlacksmith forges, taken in connection with other chemical reactions going on in the mine, from earth, minerals and decayed wood. We find that the fire was kindled in the winze over and from sparks rising from the Belcher blacksmith shop. We severely censure the managere of the mine for allowing the hlacksmith shop to be located underground, thereby cansing the death of six highly-esteemed citizene; and we also recommend that hereafter no blacksmith shops or firee of any kind be allowed in any of the mines on the Comstock lode."

Mr. Samuel Jones, Superintendent of the Crown Point mine, eensibly intende taking some precautionary measuree to prevent loes of life in case of such accidente. Hie plan as pnblished in the *Enterprise* is as follows: He intends arching over each tunnel connecting on the several levels of the Crown Point with other mines with solid masonry for a distance of eeveral feet. In theee arched ways he will place, a few feet apart, two eets of iron doors, eo arranged that they may be closed at a moment's warning. The donble doors of iron will resist any explosion that is likely to occur, and at the same time will prevent deadly gasee finding their way through in sufficient volume to strike down the workmen without a moment's warning, as they were stricken down dnring the late fire and in that of 1869. The drifts being clear of timhere for a considerable distance, it will cut off the mines adjoining it and form a perfect wall of defence againet the advance of any fire that may occur on the outeide of the mine; and in case of a fire in the Crown Point, the arched drifts and iron doors wonld serve to prevent the fire epreading to the mines adjoining. The coet of doing thie work would he a mere trifle, when we consider the value of the mine and the sense of eecurity euch an arrangement would give to both the miners and the owners of tbe mine.

These mines contain ench a large amount of timher that if they once caught fire it would take probably eeveral yeare before the mines could be entered. The caves ensuing would deetroy a large amount of property, and perhape eome lives. Mr. Jones' plan seems a good one and ae hlackemiths' forgee will probably be abolished in the mines, and sent to the npper regione, and additional precantione adopted, we do not expect to hear of any more accidente until thie one is forgotten. The miners themselves, are, generally epeaking, the most careless people in the world, never thinking of danger until they meet it face to face. This being the case, it becomee the dnty of their employers to adopt the necessary precantions to prevent accident.

Peavine District, Nev., is increasing in prosperity since the ledge was etruck in the Poe mine. A mill is being bnilt on the mine; the machinery is on the ground and the bnilding has been completed. Prospecting has been going on in the district for some time to find the ledge which has supplied the placer mines with gold. After being struck in the Poe mine it wae fonnd in the Paymaster tunnel, 350 feet in. There is considerable excitement over the prospect of the camp and a town eite has heen located and surveyed, called Poe City.

The Newark mine in Pioche has a three foot steak of good ore, eome of which runs $200 per ton. The Caroline mine people who helieve that the hody ie in their ground are running a drift to prove their aesertion.

The Crown Point and Belcher mines on the Cometock lode have produced upwards of $26,000,000, of whioh $14,000,000 hae been paid out ae dividende. There is plenty of rich ore yet in the bonanza.

The Mining Districts of Utah.

The accompanying map, showing the mining districts and railroads witbin sixty miles of Salt Lake, was prepared for the *Utah Mining Gazette*, by Col. B. A. M. Froiecth, and will be of interest as a means of reference to parties investing in mining property in those localities. The map shows some of tho principal mining districts situated in the Wasatch and Oquirrh ranges of moantains. The Wasatch is a very extensive rauge, traversing the entire Territory from nortb to south, and it contains a large number of districts, only a portiou of which, however, are ehown on the map. By referring to the map it will be seen that fourteen organized districts are shown in the Wasatch range, one on an island in Great Salt Lake, seven in the Oquirrh range, one southwest of Stockton, in the Cedar range, and one in the Pelican Point range, west of Utah Lake. These districts commencing with Willow Creek, on the northeast corner of the map, are numbered respectively from one to twenty-four, in which order we shall proceed to doscribe them as fully as our space will permit.

Willow Creek District (No. 1) is in Box Elder county, about 6 miles from Corinne and 50 miles from Salt Lake City. It was organized in 1870, but has been very little developed. Ahout all that can be said of it is that quantities of argentiferons galenn and also eome gold-bearing quartz have been discovered, which when properly developed may provo as valuable as tbat found in other districts.

Mineral Point District (No. 2) is in Cacbe county, nbout sixty-five miles from Salt Lake City, and was organized in 1870. The ores are principally iron, large deposits of whicb have bsen discovered. This district bae lately attracted considerable attention from outside capitalists, and ae it is only 18 miles dietant from Brigham City, on the Utah Northern Railroad, it is anticipated thnt before long it will be extensively developed.

Weber District (No. 3) is situated in Morgan county, aboat 35 milee from Salt Lake City direct, and was organized in 1870. The character of the oree ie principally argentiferous galena, but some iron and gold have been found. The remarks made concerning Willow Creek are applicable to Weber, and aleo to Farmington (No. 4), and Centerville (No. 5), which are in Davis county. It ie impossible to pronouuce upon their real value until they are more fully developed.

Adams District is in City Creek Cañon about 10 miles from Salt Lake City. It was formerly embraced in the Hot Spring District which was organized in 1870. The ores are principally iron, argentiferous galena, and some milling rock carrying a small per cent. of gold.

New El Dorado District (No. 7) is in Salt Lake county, about 10 miles from Salt Lake City, and was organized in 1870. This district, as well ae the others of the Waeatch range, ie accessible from Salt Lake City either by stage direct or by the Utah Southern Railroad to Sandy Station, and thence by stage. New El Dorado ie about eix miles wide by ten milee long, and embraces Emigration and Parley's Park cañone. The ore is principally argentiferous galena.

Big Cottonwood M. District (No. 8) is 22 milee southeast of Salt Lake City. The general formation of the district ie limestone and quartzite, the former predominating. The ores are principally argentiferous galena, and carbonatee of lead carrying silver, with traces of antimony and arsenic. The mines in thie district are very valuable, and are continually being worked.

Uintah M. District (No. 9) is 35 miles from Salt Lake City, and ie located on the divide between Parley's Park and Provo Valley. It was organized in 1870, and is about four miles square. The ores are of a high grade and are both milling and smelting.

Little Cottonwood (No. 10) is about 25 miles S. E. of Salt Lake City and is accessible from it by the Utah Southern R. R. to Sandy Station, chance by the Wasatch and Jordan Valley R. R. to Fairfield Flat, which ie the winter terminus of the road, and distant about 12 miles from Sandy. The district is 10 miles long by 4 miles wide. The character of oree is varied, but they are principally carbonates and argentiferous galena. Tho mines in the district yield about 2,400 tone of ore per week or annually about 120,000 tons, valued at $7,200,000. From 500 to 600 men are employed duriag the busy season. The smelting worke in the Cañon are the Flagetaff works with three furnaces, the Davenport, one furnace, and the Monitor patent force blast smelting furnace. We have before given detailed descriptions of the mines and furnaces of this district in the letters of our traveling correspondent, L. P. Mc., who is now in the Territory in the interests of the Press.

American Fork District (No. 11.) is in Salt Lake County, S. E. of Little Cottonwood, 40 miles from Salt Lake City, from which it is accessible by the Utah Southern and American Fork R. R. It was organized in 1870 and is about 6 miles square. The ores are both smelting and free milling, the former predominating. The Sultana Smelting works in Forest City have three furnaces in constant operation.

Snake Creek District (No. 12.) is E. of Little Cottonwood and American Fork Districts about 55 miles from Salt Lake City, from which it is approached by wagon road by way of Parley's Park, and from Provo City up the Provo River. It was organized in 1870 and is about 8 miles long and from 3 to 4 miles wide. The ore is principally argentiferous galena.

Silver Lake District (No. 13) is 35 miles from Salt Lake City in Utah Co. and is accessible by all rail communications. It was organized in 1871; ore principally argentiferous galena.

Cook District is E. of Provo and Springville in Utah Co. 50 miles S. of Salt Lake City and was organized in 1870. Very little proepecting hne been done.

West Mountain or Bingham Cañon District (No. 15) ie in Salt Lake county, 25 miles S. W. of Salt Lake City, across the Jordan Valley. It, as well ae the other districts in the same range, is accessible at present only by a daily line of stages; hut the Bingham Cañon and Camp Floyd R. R. now in course of construetion will bring them in direct rail communication with Salt Lake City. The district was organized in 1863, and is 12 miles long by 5 miles wide, containing eeveral cañone and gulchee, viz: Bingham Cañon, Silver Hill, Bear Gulch, Spring Gulch, Carr Fork, Muddy Fork, Markham Fork and Butterfield cañon in esch of which a certain distinct character of ore predominatee. The district ehips about 600 tons of ore weekly on an average. The Winnemuck Co., have ten furnaces.

Tooele M. District (No. 16) ie in Tooele county, 30 miles distant from Salt Lake City. The district wae organized in 1870, and is ahout 8 miles long and 4 milee wide. The oree are hoth milling and smelting.

Stockton or Rush Valley District (No. 17), ie aleo in Tooele county, thirty-five miles distant from Salt Lake City. It was organized in 1864, and is about six milee long by five miles wide. The oree are principally argentiferone galena and carbonate of lead, and are unequalled for smelting purposes. The carbonate ores of the Stockton mines are very easily smolted, and can be used as a flux for all the other ores produced in the surrounding districts, as their peculiar composition renders it practicable to mix them with other ores in any quantity. There are three smelting works in this district in constant operation.

Ophir Mining District (No. 18) in Tooele county, forty-five miles from Salt Lake City, was organized in 1870. It is six miles long by five miles wide, and consists of East Cañon, Lion Hill, Silverado Hill, Chloride Hill and Dry Cañon. The ores are of a high grade, and very varied in character, and are about equally divided, one-half being milling, and one-half smelting ores. There are two stamp mills and six smelting works in this district.

Lower District (No. 19) is in Utah county, fifty miles from Salt Lake City. It was organized esrly in 1871, but very little development has been made so far, and there is little or nothing doing there at present.

Camp Floyd District (No. 20) is in Tooele county, about sixty miles from Salt Lake City. It was organized in 1871, and is about five miles long by six miles wide. The ore is free milling rock, comprising antimonial and horn silver. This district is one of the finest in the country for milling ores and it has also produced the pureet bullion ever refined in Utah, being 999 fine. There is an excellent twenty stamp mill in thie camp, belonging to the Camp Floyd Silver Mining Company, of London and another for custom work is located at Fairfield. Profitable results are soon expected from the English company's mines, now under the able management of Henry Sewell, Esq., who has had great experience in treating this clase of oree.

Osceola Mining District (No. 21) is southb of Camp Floyd, in both Utah and Tooele counties. It containe principally free milling oree in a limestone formation. It is not much developed, and there is very little prospecting going on at present.

Columbia District (No. 22) ie in the Onaqui Mountains, west of Rush Valley, and southwest of Ophir District, eixty miles from Salt Lake City. It gives very promieing indications of becoming a flonrishing camp. Argentiferous galena ie the principal metal found, of which twenty-five tons per day are now produced.

Pelican Point District (No. 23) is in the mountains of the same name west of Utah Lake, forty miles from Salt Lake City. It was organized in 1871, but is very little known and has heen hut little worked. The ore is principally milling and yields a fair percentage of silver.

Antelope District (No. 24) is on an island in Great Salt Lake, eighteen miles distant from Salt Lake City. It was organizsd in 1871, and at one time created considerable excitement on acconnt of the discovery of large deposits of manganese, together with copper and iron. Only one mine is worked there at present, employing four men, which is yielding a considerable qaantity of copper ore.

The foregoing comprises a list of the principally developed mining districts in Utah, with the exception of those in the southern part of the Territory. The southern counties also contain large qnantities of valuable minerals, among them coal and iron, which are in process of development, aad which will add very materially to the wealth of the country if only properly utilized at home, by doing away with the necessity of so much foreign importation. To this end cheap railroad transportation is the one thing needful.

Scale 15 miles to an inch.

THE MINING DISTRICTS AND RAILROADS WITHIN SIXTY MILES OF SALT LAKE.

Silkworm Eggs.

This time a favorable report comes to us from Mr. J. F. Souffringnon, four miles from San José. Mr. S. has been successful in growing over fifty ounces of fine healthy eggs, of the French annual variety. The worms were hatched early, fed on white mulberry—*Morus Alba*—in a building of plank, the inside papered and ventilated by openings in the upper and lower portions of the building.

His experience teaches him that there should be a ceiling between the feeding room and the roof, as a preventative against too great heat by day and too much cold by night, which will transpire if no ceiling ie interposed between roof and room below. Egge begin to hatch when the temperature risee to 60°. The first and second days' hatching are not as healthy as the worme from the third, fourth and fifth days, nor are those that come on after the fifth day. They often make fair looking cocoons, but the worms are not so strong or healtby.

Mr. S. is of the opinion that with labor at one dollar a day he can grow eggs at $5 per ounce with profit; but with labor at that price, he cannot grow silkworme for their silk and make it pay. We would like to hear of thie year's success in silk growing in Nevada county and the profit attending its culture. Who can inform us?

Meetings and Elections.

Table Mountain Blue Gravel M. Co., Sept. 29.—Trustees: J. W. Roberts, J. W. Gashwiler and J. F. Boyd. At a subsequent meeting J. W. Roberts was elected President; G. D. Roberts, Treasurer; W. M. Hellman, Secretary; and W. G. Gillette, Superintendent.

Eureka M. Co., Nevada, Sept. 29.—Directors: J. B. Haggin, Chas. E. Elliott, Wm. Willis, Jas. Clark (President), Thos. Derby, Geo. D. Roberts, and T. P. Beach (Secretary).

Alaska M. Co., Coleman District, Lyon Co., Nevada, Sept. 29.—Directors: J. H. H. Williams (President), H. T. Wheeler, H. P. Wakelee, H. C. Ribbe, Chas. T. Holbrook (Secretary, Geo. R. Spinney.

North Star M. Co., Grass Valley.—Trustees: A. K. P. Harmon (President), Thomas Bell (Vice President), John O. Fall, Wm. B. Bourn and J. W. Gashwiler.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

Suisun Marble Co., Sept. 30.—Object: To do a general business in quarrying, shipping and dealing in marble. Directors: R. F. Knox, Michael Heverin, Samuel L. Theller, Whilliam Sherman, John M. Coughlan. Capital Stock: $1,000,000, in shares of $50.

Kit Carson M. Co., Sept. 30.—Location: Elko county, Nevada. Directors: A. P. Mincar, Frank Swift, T. J. Shackleford, D. L. McDonald and J. C. Vimout.

Alden Fruit Preserving Co., Sept. 30.—Object: The treatment and preservation of fruit, meat, fish and all animal and vegetable material, and all manufacturing and mechanical purposes and operations connected with or pertaining thereto; to deal in fruit, meat and fish, and to transact all business appertaining thereto. Directors: Geo. W. Deitzler, Frank Pyle, Thomas Cole, William M. Wherry, D. P. Belknap. Capital stock: $250,000, in shares of $50 each.

Mint Operations.—The employés at the Mint in this city are kept pretty busy now-a-days, and have turned out a large amount of coin during the past few months. Last month the coinage was as follows: Double eagles, $2,040,000; half eagles, $45,000; quarter eaglee, $17,500; this makes $2,102,500 in gold. The silver was as follows: Trade dollars, $137,000; half dollars, $19,000; dimes, $6,000; total, $162,000. Total coinage for month, $2,264,500.

For the three months ending September 30th, the coinage amounted to $7,477,500, of which $7,162,500 was gold and $315,000 was silver. Included in thie statement was the sum of $7,100,000 in twenty dollar pieces.

The Quartz Mines of Calaverae County are in a flonrishing condition and the propects in the various campe are encouraging.

System in Irrigating.

It has heen the custom in this valley for persons to eupply themselves with water from any stream within their reach hy using obstructione or other temporary means; and with very little regard to the rights or welfare of others. Thus the lack of system has rendered the chance of eupply uncertain by this tampering with the sonrce; and demoralization and discouragement have followed efforte at improvement. When the Wuchumna Water Co. undertook to extend its works above the town, there were those who entertained the hope that system and confidence might take the place of disorder, distrust, extravagance and failures in irrigating, as some of the men connected with the enterprise were known to have had experience in handling and distribnting water. We now learn that little or nothing has heen done, or will probahly he done, in preparing to run water in thie direction, for the reason that hut few of the property-holdere of the town have taken any interest in the enterprise. If the work ehould be extended southward, less than one mile additional of canal would enable the Company to reach the hed of the Packwood and thus to open up the whole of the fertile region between here and Tulare, in which a lack of water is about the only drawback. We understand that many of the land owners along the line indicated are alive to the importance of the enterprise.

Thue onr eupiuenese is liahle to re-enact our railroad experience! We could hardly expect that a system worthy of the name could be provided for a town situated like ours is without our citizene heing called upon to contribute five or ten thousand dollars to the capital stock of the Company. If this enterprise begins in the wrong direction and is unworthy of our confidence, for the credit of the place let us eay nothing ahout it until we have commenced a proper system elsewhere; and not have it said that a civilized community have, for a quarter of a century, occupied a valley as fertile as that of the Nile, without organizing an effort to develop ite capacities for irrigatiou, and other resources.—*Tulare Times.*

THE YELLOWSTONE EXPEDITION.—The expedition under Captain W. A. Jones, of the engiueer corps, sent out hy the Government to survey the route to the Yellowstone Lake, has arrived at Camp Brown, Wyoming, on its returu. They found three passes iu the Yellowstone Valley from the east and west. One route via the head of Wind River is easy for a wagou road, and through a very fine country. The pase is a very easy one. It is 160 miles from Camp Brown to Yellowstone Lake. The results are quite gratifying. General Ord, commanding, regards it as certain that a wagon road will soon he opened from Point of Rocks, on the Union Pacific Railroad, to the lake.

Advices from the Yellowstone Expedition, under date of Septemher 6th, hy way of Bismark, September 16th, state that General Custer, with three squadrone of the Seventh Cavalry, together with the engineers, reached the stockade of the Yellowstoue river, September 4th, having separated from the main command in the three days' march east of the Mussle Shell river. Stanley, with the infantry, and one squad of cavalry and train, struck directly for the old trail of the Yellowstone, and wae not expected at the stockade until the 12th. The expedition hae been a complete success, every object for which it was inaugurated having been effectnally accomplished. An area of three hundred miles of unknown country to the west and south of the Yellowstone has heen explored the Indians thoroughly whipped, and the snr vey of the Northern Pacific Railroad completed

---

SAFETY AT SEA. — The recent sudden destruction of two large passenger ships, the Atlantic and City of Washington, hae called attention to the deeirability of availing ourselves of the means which modern science has placed at our command for the prevention of snch disastrous accidente. For this purpose, each large passenger ship ehould carry a small, but powerful steamboat or launch, and in foggy weather thie steam launch should he sent on ahead some few hundred yards, being counected with the paesenger ship hy a flexihle telegraphic cable, provided with an electric battery, eo that signals or meeeages might be continually trausmitted from one to the other. The steam launch should also carry an electric or other strong light, and he provided with a powerful steam whistle. On meeting with ice or with vessels, or unexpectedly approaching the coast, it would be comparatively easy to stop the steam launch and give warning in time to save the paesenger ship from danger. The suggestion ie due to Mr. John Newlande, F. C. S.

ENGLISH censue returns for 1871 show that there is a gradual increase in the length of human life on the islaud. A few decades ago the average life of the Englishman was reported at 25 years; now it is 44 years. Notwithstanding this fact, for such we take it to be, there are less aged people in England than in America. It was not long ago that an eminent English writer stated that he did not helieve that there existed in the civilized world a person who had reached one hundred years, hut we have in this country several well atteeted instances where one hundred and ten, and even one huudred and twenty years have been reached. At the preeent rate of increase it will be some time before England exhibits many Methusalehs, hut it willno t be long before men will live to see their three score and ten years.

The Mining and Scientific Press Marching Onward!

Our carsful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders th paper worth more to readers, who can find handily tha which interests them most.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS 1 not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum. Single copies, post paid, 10 cents. Address

DEWEY & CO.,

MINING and SCIENTIFIC PRESS and PACIFIC RURAL PRESS Office, 338 Montgomery St., S. F.

Table of Convenient Dates for Advertising Assessments

And a true copy of the NEW CODE CONCERNING THE LEVYING AND COLLECTING OF ASSESSMENTS OF CORPORATIONS will be furnished FREE on application at our office.

Also, BLANKS for making out Assessment Notices, Delinquent Sale Lists, and all information desired regarding the advertisement of assessments. Special attention given to assisting Secretaries to advertise legally and correctly—by giving them the benefit of our thorough experience in mining advertising. Extra copies of advertisements printed to mail to stockholders whenever desired. Call at our office, or send word to our special mining advertising agent.

DEWEY & CO., Publishers,

No. 338 Montgomery, S. E, Cor. California, diagonally across from Wells, Fargo & Co.'s.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS,
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

PACIFIC RURAL PRESS
BY
DEWEY & Co.
PUBLISHERS SAN FRANCISCO.
A FIRST CLASS
Agricultural Home Journal.

EACH ISSUE CONTAINS

Sixteen well filled pages.
Original and Choice Engravings.
Editorials on Home Industries.
On various kinds of Stock-rearing.
On Horticulture and Gardening.
Correspondence from Farming Districts.
Answers and hiuts to Correspondents about Local Farming.
Good Health and Useful Inform tion.
Reports of Farming Clubs.
Mechanical and Scientific progress.
Agricultural Notes from all quarters.
Domestic Produce Markets.
Home Circle.
Domestic Economy.
Mechanical Hints and Domestic Receipts.
Home and Farm Matters.
Affording, in all, more of real instructive and profitable matter for general readers than any other weekly on this side of the Continent.

Subscription, in advance, $4 a year. Single copies 10 cts. Four single copies, of late dates, sent postpaid for 25 cts.

DEWEY & Co.,

Publishers, Patent Agents and Engravers, No. 338 Montgomery street, S. E. corner California, S. F.

Useful Inventions

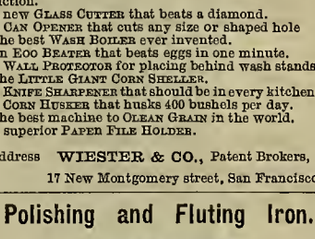
—FOR THE—

House, Field and Farm.

A safe and perfect FIRE KINDLER.
A HORSE RAKE that has no equal.
Parshall's LUBRICATORS for Locomotives and Stationary Engines.
SHEARS for cutting grapes and flowers.
A new ROLLER SKATE that is superior to all others.
Self-Regulating DRINKING FOUNTAIN for fowls.
A superior ROAD SCRAPER.
The cheapest and best FARM FENCE ever built.
A POST DRIVER that every farmer should have.
A SASH TIGHTENER that keeps out all dust, takes the place of weights, and keeps the windows from rattling.
A BED SPRING that never gets out of order.
A POTATO DIGGER that will dig a row as fast as a man can walk.
A HOUSEHOLD TOOL needed in every family.
A GAS LAMP that costs only half a cent per hour to burn.
The best SELF-OPENING GATE ever invented.
A PLOW on a new principle—it works to perfection in adobe.
An improved PLOW CLEVIS.
A TOY ENGINE that every boy should have for instruction.
A new GLASS CUTTER that beats a diamond.
A CAN OPENER that cuts any size or shaped hole
The best WASH BOILER ever invented.
An EGG BEATER that beats eggs in one minute.
A WALL PROTECTOR for placing behind wash stands.
The LITTLE GIANT CORN SHELLER.
A KNIFE SHARPENER that should be in every kitchen.
A CORN HUSKER that husks 400 bushels per day.
The best machine to CLEAN GRAIN in the world.
A superior PAPER FILE HOLDER.

Address WIESTER & CO., Patent Brokers,
17 New Montgomery street, San Francisco.

Polishing and Fluting Iron.



This new invention takes the place of two articles needed in nearly every house. As a POLISHING IRON it has no superior. The part used for Fluting is made of brass, and highly polished. A Receipt for making FRENCH GLOSSING STARCH, that gives a superior polish, goes with each iron. The Polishing Iron and Fluter, being in one, are both heated at the same time. We are now prepared to furnish them in quantities to suit.

Price, $3.

WIESTER & CO.,
17 New Montgomery street, San Francisco,
General Agents for Pacific Coast.

Subscribers, Examine Your Accounts

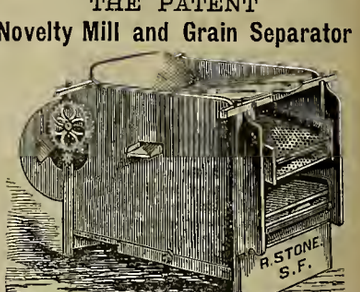
We also continue to sell that Household Gem, the

HOME SHUTTLE SEWING MACHINE.
PRICE, $45.

THE PATENT Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chloriation Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is uncqualed by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

[Continued from Page 213.]

west drift at the second station continues to improve in hoth looks and quality as the work of development progresses. The dumps are all full of ore awaiting an oportunity to get it crushed.

TYLER.—Sinking the shaft is making good progress, the rock in the hottom working well. Small seams of quartz, of a very promising character, are occasionally encountered in sinking, and there is a slight increase of water, hut not enough to impede the progress of the work.

CHOLLAR-POTOSI.—Daily yield 120 tons of ore, the assay value of which is $36 per ton. The ore hreasts continue to look well, and yield the usual amount of ore. Nothing else new to report.

SIERRA NEVADA.—Daily yield, 60 tons of ore, keeping the company's mill husy. The ore hreasts are looking and yielding finely as usual; in fact, the ore is rather improving in quality as the work penetrates deeper into the hill.

KOSSUTH.—The main shaft is down 210 ft., the rock iu the hottom working finely, and the sinking making excellent progress. Some little water was encountered during the week, hut not sufficient to interfere in the least with the progress of the work.

OVERMAN.—Sinking the shaft is making good progress, the rock in the hottom working finely. Some good indications of ore have heen developed in the cross-cuts from the main west drift at the 1,000-ft. level.

[From the Daily Mining Press of Sept. 27, 1873.]

We Drop Anchor!

The wind don't just suit us for a long voyage and we have concluded to quit our *daily* mining cruise. Having sailed on the square, we wind up the publication of the DAILY MINING PRESS to-day with a clear record, satisfactory, we believe, to "all concerned." If aught be due to any, call at the office of the MINING AND SCIENTIFIO PRESS, No. 338 Montgomery St. Generous patrons "good morning!"

Convinced now that we can do better service at the present for the mining public by bestowing additional attention to our weekly, the MINING and SCIENTIFIO PRESS, we shall, on closing our daily, bend our energies more in that direction. Established in 1860, that journal has steadily advanced, and is even now more prosperous than at any former period.

Mining advertisements will be published in the MINING AND SCIENTIFIO PRESS at our regular and extremely low rates. No other journal has so many mining readers. All corporation notices in the DAILY MINING PRESS have been published simultaneously and legally in the MINING AND SCIENTIFIO PRESS, and will be so continued to the end of this term of publication.

WITH 1000 subscribers like the following, our Daily might have heen a never fading light:

SAN FRANCISCO, Sept. 24, 1873.—EDITORS DAILY MINING PRESS—Gents: I hegin to prize more and more your little daily. At first, I deemed it an experiment of doubtful success, and I predicted for it an ephemeral existence. But now I peruse it every day with pleasure as well as profit. If I have not time during the day to read it in husiuess hours, I place it in my pocket to examine at my leisure. I consider it a medium for information of a specific character, not found in any other journal, increasing in interest every issue. It is worthy of the support and patronage of all who feel intereated in mining matters and the development of that interest. In a small space you condense a large amount of very useful and practical information. Your enterprise is worthy of success, and I hope it will be appreciated as t ought to be. Respectfully yours, W. B. S.
422 Montgomery street

TO THE PUBLIC.

THE PAIN-KILLER manufactured by PERRY DAVIS & SON has won for itself a reputation unsurpassed in medicinal preparations. *The universality of the demand* for the Pain-Killer is a novel, interesting and surprising feature in the history of thls medicine. The Pain-Killer is now regularly sold in large and *steadily increasing* quantities, not only to general agents in every State and Territory of the Union, and every Province in British America, hut to Buenos Ayres, Brazil, Uraguay, Peru, Chile, and other South American States, to the Sandwich Islands, to Cuba and other West India Islands; to England and Continental Europe; to Mozambique, Madagascar, Zanzibar, and othcr African lands; to Anstralia, and Calcutta, Rangoon and other places in India. It has also been sent to China, and we doubt if there is any foreign port or any inland city in Africa or Asia, which is frequented hy American and European missionarics, travelers or traders, into which the Pain-Killer has not been introduced.

The extent of its usefulness is another great feature of this remarkable medicine. It is not only the best thing ever known, as everybody will confess, for hruises, cuts, hurns, etc., but for dysentery or cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of British India and the West India Islands and other hot climates, it has hecome the *standard medicine* for all such complaints, as well as dyspepsia, liver complaint, and other kindred disorders. For coughs and colds, canker, asthma and rheumatic difficulties, it has been proved hy the most abundant and convincing trials and testimony to be an invaluable medicine. The proprietors are in possession of letters from persons of the highest character and responsibility, testifying in unequivocal terms to the cures effected and the satisfactory results produced, in an endless variety of cases, by the use of this great medicine. That the Pain-Killer is deserving of all its proprietors claim for it is amply proved by the unparalleled popularity it has attained. It is a *sure* and *effective* remedy. It is sold in almost every country in the world and is becoming more and more popular every year. Its healing properties have been fully tested all over the world, and it need only to be known to be prized.

Sold hy all Druggists. sep13

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

Hie patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.

Dutch Flat, August 1, 1873. 6v27-2m

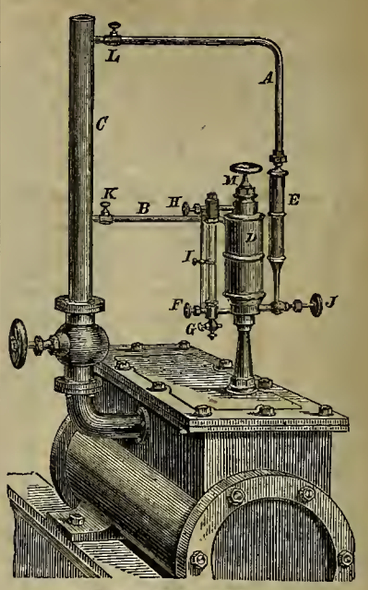
10v27tf No. 32 FREMONT STREET.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Parshall's Lubricator for Steam Engines.

These Lubricators are suited to all steam Engines, delivering the lubricant, whether tallow or oil, to every kind equally well. They are subject to be placed in the steam pipe, steam chest cover or the cylinder head, as is desirable. They admit the steam freely to the lubricant, which is constantly saturated with it and kept thereby in a free liquid state. When condensation of the steam begins, the water settles below and raises the oil to the top. The oil is fed from the top of the cup, through a tube which passes down through its center. All sediment in the oil settles to the bottom of the cup, and the oil, on going to feed the engine, is always pure. By simply turning a screw in the top of the cup, the flow of oil is regulated to suit the requirements.

We have numerous testimonials from Railroad Engineers and others, speaking in the highest terms of their superiority. The first one put in use on this coast is at the Pacific Saw Manufactory in this city. Parties desiring further information will please send for descriptive circular and price list, or call at our office.

Metallurgy and Ores.

EAGLE IMPROVED CHLORINIZING FURNACE.

For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

THOS. McGLEW & CO.

P. O. Box 2028. GEO. D. WYMAN,
5v27-3m Superintendent.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

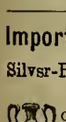
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates, for Saving Gold.



Of all sizes and in any quantity, furnished to order. Full instructions sent for operating. Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work replated.

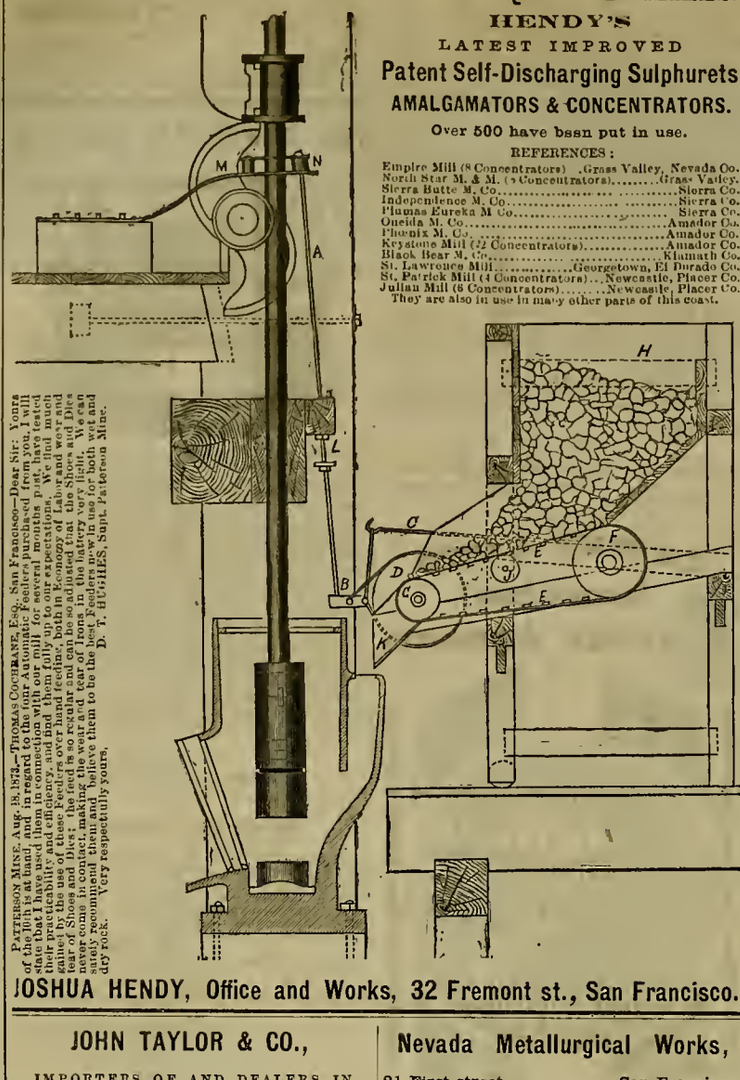
COCHRANE'S ORE FEEDER FOR QUARTZ MILLS.



PATTERSON MINE, Aug. 18, 1873.—THOMAS COCHRANE, Esq., San Francisco—Dear Sir: Yours of the 15th inst. received. In reply to the four Automatic Feeders purchased from you, I will state that I have used them in connection with our mill for several months past, have tested their practicability and efficiency, and find them fully up to our expectations. We find much gained by the use of these Feeders over hand feeding, both in economy of labor and wear and tear of Shoes and Dies, as they feed more regularly and evenly, thereby saving the wear and tear of Irons in the battery very light. We can safely recommend them and believe them to be the best Feeders now in use for both wet and dry rock. Very respectfully yours, D. T. HUGHES, Supt. Patterson Mine.

BURLEIGH ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

WEDNESDAY M., Oct. 1, 1873.

Shippers are obliged to get rid of their surplus stock, which is sent to the East, Japan, etc. This creates some activity and a constant steadiness in the Leather market, as the same shipments are made, whether the exporters make or not hy the process Harness Leather of all grades is in particular request just now. Prices of other kinds, too, appear to be stiffening considerably. The fall trade generally is much better than was to have been expected from its unpropitious opening.

The Mining & Scientific Press,

Started in 1860, is ona of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprictora for ten years, during which period it has been repeatedly onlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other puolisners have accumulated on this coast, of a weekly journal.

The sum paid hy us for the best editorial talent obtainsble for our special class journal; for eugravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled hy that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific Statea.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professioual Man, and Progressive and Industrial Studeut should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit hy its illustrations and descriptious of New Machinery, Processes, Discoverias and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical. PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every hranch of Patent ousiness, and obtain Patents in *all civilized countries*. The large majority of U. S and Foreign Patents granted to inventors on tho Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE.

DEWEY & CO.,

Publishers, Patent Agents, and Engravers.

No. 338 Montgomery st., San Francisco, Cal.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may ba quickly fastened and retained in book form at the end of the volume, and the hinder (which is very durable) used continnously for snbsequent volumes. Post paid, 25 cts. extra. It can be nsed for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS.

lambp

GRATIFY YOUR FRIENDS AND ACCQUAINTANCES by sending them an occasional copy of this paper. Persons in the Eastern States, or in other countries, will find much that is novel and fresh to them in its contents.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illnstrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain pa tents, and about tha rights and privileges of inventors and pstentees: list of Goverment fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

THE COMPLETE WASHER.

The above cut represents the COMPLETE WASHER fitted to a tub with the side of the tub cut away to show how it is fastaned for use. There is probably no other class of fnventions on which there has been so much inventive talent employed as on machines to wash clothing, and yet at the present day there are but few washera of any practical utility.

Any person who will carefully examine the COMPLETE WASHER will be convinced that tha inventor has struck the right principle, and that this machine is not merely a device with a *handle* and a *name*, but a real laborsaving machine for practical every-day use. It is simple in construction and more simple in its operation. It will fit any size tuh and will wash any garment from the smallest handkerchief to the largest blanket. It does the most washing where the most washing is required—remaining at the will of the operator—on soiled wristbands, collara, etc., until they are entirely clean. The price of tha machine is small, which enables those who hava the most nead of a washer to buy one. We desire to get a good traveling agent for each county on the Pacific Coast.

WIESTER & CO.,

17 New Montgomery street, San Francisco.

NOTICE TO BUILDERS.

SEALED PROPOSALS, for furnishing certain materials and constructing a portion of the Napa State Asylum Building for the Insane, will be received at the office of the President of the Board, No. 204 Sutter street, San Francisco, until 12 o'clock M. of the 30th day of October, 1873.

The printed specifications and printed forms of proposals can ha had on application to Messrs. Wright & Sanders, Architects, 418 California street, where plans and drawinns can be seen and all further information obtained. No bids will be entertained unless made on the specified printed forms of proposals and accompanied with a certified check or bond with two or more good and sufficicut sureties, in a sum equal to ten per cent. of the total sum of the tender, to be returned on the due entering into tha contract by the party to whom it may be awarded, or to be forfeited if the party fails to enter into the said contract.

The Board reserves the right to reject any or all bids.

oc4-tf J. F. MORSE, President of the Board.

MOUNTAIN RANCH FOR SALE.

A valuable and productive ranch is offered for sale, located on the public road, between Grass Valley and Colfax. The ranch contains 560 acres of land—320 paid for, and patent received for 160—containing all the best meadow land, and 400 apple trees 16 and 18 yaara old. There are six lots of 40 acres each, railroad land, which will make the title good to any buyer. The dwelling house is not furnished yet; it contains ten rooms, lathed and plastered; 6 on the upper floor and 4 on the lower, with hall; a good stone cellar and one good harn. Last year 1,000 boxes of winter apples were shipped. There are 200 pear trees, and plums and peaches enough for family use. The owner cuts from 30 to 40 tons of meadow hay per year. There are from 5,000 to 7,000 cords of wood, worth $1 por cord, now standing upon the ranch. Terms liberal. Apply to

At the lowest Market Prices.

HALLIDIE'S

Patent Endless Wire Ropeway.

Co ered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up hy you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get ont of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be douhled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. C. GOODWIN.

EMMA HILL CONSOLINATED MINING Co., Little Cottonwood, Utah.

SUPERINTENDENT'S OFFICE, Sept. 23, 1872.

T. M. MARTIN, Esq.,—Sir: The Ropeway constructed hy you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work tor the Company, and recommend it to others wishing a sure and speedy transit across over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,

113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, OCTOBER 11, 1873.

VOLUME XXVII. Number 15.

California Animals, Insects, etc., for Europe.

The Paris Acclimatizing Society has decided upon the importation, naturalization and the propagation, in France and French Colonies, and in various sections of the globe, of animals, mammalia, birds, fishes, insects, plants, etc., which may improve the alimentary, medicinal, or industrial productions of any country or at any rate serves for the purpose of embellishment. There exists in many regions a large number of plants and animals which can be very easily made the subject of such an attempt. M. Drouyn de Lhuys, an eminent French Statesman, and formerly French Minister of Foreign Affairs, who has for many years been President of the French Acclimatizing Society, has written a letter to Mr. Edmund Breuil, Consul General of France in this city, requesting his coöperation in this enterprise, and encloses a series of questions comprising the principal items of importation which he requires.

M. Breuil has enclosed the letter to the President of the California Academy of Sciences together with the questions, asking him to enlist the members of the Academy in the service. The French Acclimatizing Society was established in February, 1854, and by a decree of the 20th of February, 1855, was recognized as being of public utility. The importance of the enterprise they have in view induces them to write to this country in order to find out as much as possible concerning our animals, birds, plants, fishes, etc. The latter states that it is indispensable to specify the different characteristics of each animal, whether it is abundant or scarce; whether it is stationary or migratory; mode of living and breeding; manner in which they may be reared; most successful mode of cultivation of plants, etc. The species should be indicated by their common appellation and if possible, also by their scientific name. The information is wanted on the following subjects:

I. Mammalia.—1, Alimentary; 2, Medicinal; 3, Industrial, (furs, hair, wool, hides, hoofs, antlers,); 4, Domestic, (pack animals, animals used for draught purposes, watch animals, etc.); 5, Accessory, (for ornament or pastime, hunting).

II. Birds.—6, Alimentary; 7, Industrial, (furs, feathers,); 8, Domestic, (destroyers of insects, etc.,); 9, Accessory, (for ornament or pastime, singing birds, birds kept in aviaries or parks, etc.).

III. Reptiles and Fishes.—10, Alimentary; 11, Medicinal; 12, Industrial; (scales, skins, glue,); 13, Accessory, (ornament or pastime, fishes in ponds, streams, or the sea).

IV. Insects and Crustacea.—14, Alimentary; 15, Medicinal(galls for instance); 16, Industrial (silks, coloring materials, galls, wax, etc).

V. Mollusca and Zoophytes.—17, Alimentary; 18, Industrial (shells, mother of pearl, pearls, coloring materials, filaments, corals, spongea, etc).

VI. Plants—Alimentary; 20, Medicinal; 21, Industrial (coloring materials, those containing sugar, perfumes, wood, trees and the use made of the wood; 22, Accessory (those serving for purposes of ornament or embellishment on account of their foliage or flowers.)

VII. What species of animals or plants, do you desire to have introduced in your country, the Acclimatizing Society being desirous of reciprocating the advantages that it may derive from an exchange with other sections of the globe?

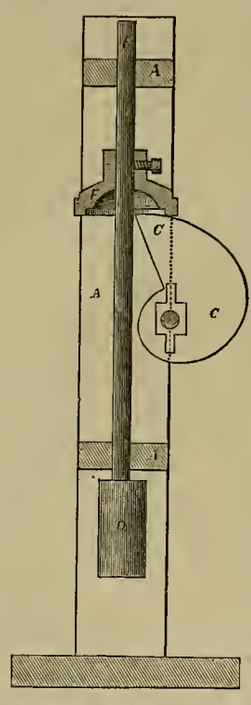
VIII. Is such an exchange of animals or plants favorable or desired by the Societies of your section.

IX. Are there any Zoölogical, Agricultural or Botanical Societies in your section, with which we might exchange publications? Any information that might assist the Acclimatizing Society will be received with the most vivid interest and you will thereby hasten its progress.

Hammond's Improved Cam and Tappet.

The accompanying cut illustrates an improved method of operating the stamps of a quartz battery, invented by William P. Hammond of Napa, Napa county, Cal. Mr. Hammond claims that by the means he employs, the stamp can be raised with a less expenditure of power than when the stamp is operated in the ordinary manner. By referring to the cut, the peculiarity of construction will be seen.

A, A, represents the ordinary frame work of the battery. The cam shaft revolves in the bearings on the frame, *A*, to which the power is applied in the usual manner. To this shaft is attached the cam, *C*, which is made somewhat spiral so as to tend to rotate the stamp stem, *E*, when it is raised. *D*, is the stamp which is attached to the lower end of the stamp stem, *E*, which moves up and down in the



Hammond's Improved Cam and Tappet.

guide holes in the frame, *A*, in the usual way. *F*, is a tappet, through which the center of the stamp shaft, *E*, passes and which is adjustably secured to said shaft, by a set screw so that it may be adjusted to cause the stamp to be raised to a greater or less hight as desired. The lower side of the tappet, *F*, is concave so that the cam, *C*, may operate only upon the edge or rim of the tappet. The tappet, *F*, is made of such a size, that the part upon which the cam, *C*, operates, may be directly over the driving shaft.

By this construction and arrangement of the tappet and cam, it is claimed friction will be lessened, the cam will rotate the stamp more surely and regularly, and the power required to raise the stamp will be diminished, the point of contact of the cam and tappet being directly over the driving-shaft. William P. Hammond or Henry Mygatt, of Napa, Napa Co., will furnish further information, if desired.

The paper mill on Clackamas river, Oregon, after a suspension of three months, has again been started up.

The Largest Gold Bar.

There has been some little rivalry of late among certain mining companies and banks as to who should make the largest gold bar on the coast, or in the United States. Three weeks ago the Spring Valley Canal and Mining Company of Cherokee, Butte county, shipped to this city a single bar weighing 141 pounds, valued at about $41,000. The company at that time thought that it was the largest ever made in the United States. Since then they learned that Seligman & Co., bankers of this city, had received a larger one from Colorado, and write to us to find out whether the report was true.

We called at several places where they would be likely to know of any unusually large bars, and find out that Seligman & Co. did have the largest one. This "boss bar" was made up by Seligman & Co.'s agents at Helena, Montana, for exhibition, and was the result of dust purchases for a month. It was 900 fine, and valued at exactly $50,000.

The largest bar received at the London and San Francisco Bank was worth $35,000.

The largest bar handled at the San Francisco Assaying and Refining Works for the Bank of California was valued at $40,000.

The mint last month received a gold bar valued at upwards of $40,000.

It is conceded by all who are posted on the subject, that Seligman & Co.'s $50,000 bar is the very largest ever made on this coast. It will be remembered, however, that it was made for the special purpose of exhibition and was intended to be the largest ever made on the coast.

Salmon Breeding on the McCloud River.

Livingstone Stone, the energetic Fish Commissioner, went East on the 30th ult. with 600,000 salmon eggs for distribution in the waters of some of the Eastern States. The expedition to the McCloud river has been a success in every respect. From a letter to one of the publishers of this journal we gather the following information concerning it:

The expedition went into camp July 20th, 1873. The first salmon eggs were taken August 26th. The first eye spots showed September 12th. The first shipment of eggs East was made September 20th. One million and a half of eggs are ready for shipment, which will be distributed as follows: To James Duffy, Penusylvania, 150,000 eggs; Seth Green, New York, 250,000; R. G. Pike, Connecticut, 150,000; Charles G. Atkin, Maine, 50,000; Cold Spring Trout Ponds, New Hampshire, 50,000; Dr. W. A. Newell, California, 5,000; E. A. Brackett, Massachusetts, 50,000; Dr. J. H. Slack, New Jersey, 800,000.

The camp will break up in three or four weeks. A very valuable collection of *salmonidae* specimens was made for the Smithsonian Institute at Washington. The eggs taken East will cost $2 a thousand in gold, while three years ago the States paid $40 a thousand for them. Mr. Stone seems to be a very persevering man, and is just suited for his office. He takes every possible measure to perfect all his plans, and as he is an enthusiast on fish, has been very successful. Fish culture is fast becoming a subject of great importance in this country, as it should have been years ago, and we hope that the time will come when every available stream and pond will be well supplied with the best species of food fish.

The Murchie mine, Nevada county, which has formerly relied on water power to run its ten-stamp mill, now has a steam engine, so that the mill can continue running in the fall when the water is low. An additional ten-stamp battery will shortly be added.

Our Patent System.

The more familiar we become with the relations that exist between progress and inventions the more thoroughly are we impressed with the great value of our patent systems as a promoter of knowledge, and a source of revenue to the government. Few branches of industry present so fair a prospect to the man of mechanical sense and judgment as that of supplying some public want with a new invention, and to the man who really possesses mechanical talent no labor is more inviting, than to explore the field of mechanics in order to discover some new and useful improvement, and no labor is better rewarded than that which results in relieving a public want.

The young man who possesses a medium quantity of brains, *mixed with a fair share of inventive genius*, can readily supply a want of capital by a proper use of his mechanical knowledge. The world is full of crude implements and machines. The boy of to-day will live to see many of our present wonderful machines superseded by others far superior. When the old Hoe hand press which was capable of printing about two hundred sheets per hour, at the expense of an exhausted human operator was first introduced to the public, the world stood aghast at the wonderful improvement and the praises of that machine still linger in our ears. But what a crude embodiment of mechanical ideas it now appears to us who are familiar with the operations of lightning cylinder presses which turn off rising 20,000 sheets per hour. And this is but one illustration out of thousands which we might produce.

Step by step we progress. One improvement suggests another, until finally we begin to wonder where this thing is going to stop, the fact is, *there is no stop*. It is invent, improve, to the end of the chapter, and when that end will be, and what the result will be when it does come, are questions which we never try to answer, and hardly stop to think about. The inventor is as necessary to the healthy organization of a community or a government as the farmer, the mechanic, the manufacturer or the skilled workman. Each has his field and each supplies the other with the means for producing successful results from his labors, and all combined form a healthy, industrious, progressive people.

International Weather Reports. — The Vienna Congress has assented, by unanimous vote, to the proposition that it is desirable, with a view to the exchange of weather reports, that at least one uniform observation, of such character as to be suitable for the preparation of synoptic charts, be taken, and recorded daily and simultaneously at as many stations as practicable throughout the world. The formal announcement of this principle, with such sanction, will tend directly to an exchange of signal service and weather reports between all civilized nations. It is interesting, in reference to American reports, to know that the Chinese Government is preparing to establish a system of storm-warnings and weather reports for China and the Chinese Coast of the Pacific.

It is stated that a gentlemen of this city will soon establish a technical school for the instruction of boys in the use of tools for working both wood and metal. The course of instruction is to combine theory and practice. An institution of this kind will furnish a practical solution of the problem "What shall we do with our boys?"

CORRESPONDENCE.

Notes of Travel in Utah.

[By our Traveling Correspondent.]

Salt Lake City,

The capital of Utah Territory, and the great head center of Mormonism, is about 12 milcs southeast of the most southerly point of Great Salt Lake, and about 36⅓ miles eouth of Ogden, the junction of the C. P. R. R., the U. P. R. R. and the U. S. Railroads; and distant from San Francisco, Cal., 917⅓ miles; fare from your city (all coin) $51.80. This city began ite existence about 28 years ago; it covere an area of about 9 square miles; the streete are wide, with running water on either eide of them, and the blocks are evenly cut in plote of ten acres each. The estimated population of Salt Lake City is 25,000, of which about 4,000 are Gentiles, and 21,000 Mormons.

The Great Mormon Tabernacle,

Situated near the ceuter of the city, occupies an entire block, including the space allotted to the Great Mormon Temple, not begun. The present tabernacle, in its unfinished state, resembles a huge sea tortoise, and is said to be 170 feet from the floor to the dome and has a seating capecity for 13,500 people, including all the galleries attached.

The acoustic properties of this memmoth structure are very good, taking into account its immense area. In one spot, however, of about 200 feet square in the centre, the words of Orson Pratt (and he is an excellent orator) become a perfect jumble, although perfectly clear and distinct, 300 feet further back from the pulpit.

The Mammoth Organ,

Of which you have heard and read so much, somewhat disappointed me. It is claimed to be the eecond in size in the world. I do not know its exact size, but having seen the one in Music Hall, Boston, I would say that it presents about three-fourths as much frontage as the latter meutioned; has places for 54 stops, 19 of which are yet to be put into position, and will require some 40 or 50 pipes yet to make it a 7½ octave organ. At present the compass is but 5 octaves. The workmanship, however, is deserving of great praise, and is as fine as any I ever saw. The tabernacle block is entirely surrounded by a granite stone wall some 15 or 18 feet high. The residence of President Young is within the enclosed block adjoining the tabernacle on the east, similarly enclosed by stone walls, and occupying the entire block. I neglected to state that the streets of Salt Leke City are laid out to the true points of the compass, north and south and east and west, and are named, commencing at the Temple Block, Esst Temple street, North Temple street, West Temple street, South Temple street, etc., and the second street verging from either of the above mentioned, are named according to the direction they run from the temple, as Second East street, Second North etreet, etc,, and so on to the suburbs of the city.

Mercantile Houses and Hotels.

The largest Mercantile establishment here is known as "Zion's co-operative mercantile institute." It has some ten departments, employs 140 clerks, and is carrying a stock at this writing of $1,400,000 in the different departments. The next largest mercantile establishment is that of the "Walker Bro's." The firm are carrying a stock of $400,000 worth of goods. They employ 40 clerks, do a banking business, and run mines, farms, etc. There are sometен or a dozen hotels in Salt Lake City, about equally divided between Mormon and Gentile proprietors. The principal oue of which, the finest structure, and the most centrally located is the "Walker House," presided over by the Kitchen Bro's.

The Surroundings of Salt Lake City.

The city itself is situated at an elevation of about 4,600 ft above the sea, and about 200 above the level of Great Salt Lake. To the east and eonth of Salt Lake City, almost as far ae "Utah Lake," is a well defined water line at a point on the west side of the Wasatch range of mountains, about 400 feet above the elevation of Salt Lake City. A peculiarity that may not generally be known, ie tbat the sink of the Carson, Truckee and Humboldt rivers in the State of Nevada, are of the same elevation as Great Salt Lake, or within a few feet of the same. Outside of one small stream in southern Utah no water rune out of that Territory, and none at all rune out of the State of Nevada, all the moisture sinking within its borders.

Extinct Volcanoes.

About 160 miles south of Salt Lake City, is the town of Filmore, the county seat of Millard Co., Utah Ter., and commencing at a point 10 miles south of Filmore, extinct volcanoes are to be seen to the extent of 21 in number within an area of 45 miles. One of these has been in action 5 times, once within the last hundred years, the lava from which flowed for a distance of 5½ miles; between these flows of lava, sre other earth formations, aud in one place where tbere exists a deep crevice, there is a cold spring of water, surrounding which is perpetual ice, although the thermometer 40 feet distant, would range from 80° to 100° during the summer season. One of these extinct volcanoes I visited rises up from an almost level plain some 60 feet, snrrounded by a dreary desert scene; on ascending this volcano to the crater, it sounds like an iron kettle. At a depth of about 65 feet in this crater and near the center, there is a green bunch of grass from 18 inches to 2 feet bigb. This crater is about 100 feet in diameter, and everything that surrounds it is as dry es a chip,

Bullion Shipments and Railroads.

Twelve miles south of Salt Lake City is located Sandy Station, from which point Messrs. Gordon & Murray shipped 12 car-loade of bullion, between the first and fourth daye of September inclusive, that aggregated 3,225 bars, valued at $260,884, which was from the Flagstaff, Last Chance, Davenport and Saturn furnaces. During the same length of time, and from the same place, Messrs. Durant & Cutting shipped 14 car-loads of bullion, aggregating 3,365 bars, valued at $302,301. If these are average shipments, it shows a cleerance of 1,647 bars of bullion daily from Granite station, valued at over $140,000. The bullion shipped by Durant & Cutting was from the Mountain Chief, Winnemuck, Flagstaff and Sheridan Hill Furnaces.

The Utah Central Railroad,

Counectiug Salt Lake City with Ogden; distance 37 miles; fare $2; gauge 4 feet 8½ inches. Passenger trains ply twice a day. John Sbarp is President and General Superintendent, and Wm. Jennings, Vice President. This road paid to its stockholders last year 9 per cent. on the capital stock. The gross earnings were 25 per cent. of an increase in 1872 over 1871. The Utah Southern is merely an extension of the Utah C. R. R. and its terminus at this writing is at Lehigh, 33 miles south from Salt Lake City. The gauge of this road is the same as the above. The manegement is a little different, Mr. Wm. Jennings being President, Mr. John Sharp, Vice President, Mr. F. Little, Superintendent. Passenger trains run over this road twice per day; fare to Lehigh from Salt Lake City ie $2.25; another branch of this road is the

Wasatch and Jordan Valley R. R.

Some nine miles are completed on this road, but the present terminus is at Granite, eight miles from Sandy Station on the Utah S. R. R. tbe junction of these two roads. The gauge of road is three feet, and the average grede is 250 feet to the mile; fare 75 cents. Passenger trains ply twice a day. Tbie road was begun iu November, 1872, and completed to Granite in April, 1873. The freighting consists chiefly of ore and bullion and granite building stone.

Union Depot Hotel,

Located at Ogden, Utah Territory, the junction of the Union Pacific, Central Pacific, and Utah Central Reilroads, is probably the finest conducted of any between your city aud Omaha. The building occupied is 158 feet long, by 30 fcet wide, and conteins 20 rooms. G. S. Erh is proprietor. From Belmont and Reese River Districts in my next.

Quicksilver Extraction.

EDITORS PRESS:—In reference to an article on the extraction of quicksilver, that appeared in the PRESS of August 23d, an explenation is given in the same paper of September 6th, 1873. This explanation in support of the 99½ p. c. quicksilver extraction, would not induce me to make any remarke, if it were not, to uee Mr. Knox's own words, for the purpose of "preventing your readers from being humbugged" by so-called practical men. To prove that 99⅓ p. c. extracted in his furnace is not imaginary, Mr. Knox gives reasons of the following style: "The suction ie strong enough to prevent the vapors of mercury from penetrating the walls; nor can any vapors escape at the charging-pot; no gases from within the furnace can possibly reach the outside and escape; it is physicelly impossible for any vapors of the furnace to penetrate the masonry; sixty hours of red heat is long enough to extract the last of mercurial vapors of the ore; no metal can be lost, except by neglect; nothing excapee us, and we believe the amount of metal escaping by the coke chimney to be very small—I think—I am well satisfied," etc.

Now, I repeat what I said in another article. "Belief only is required," and the 99½ p. c. is all right. It might be a good hint to millmen to retort their amalgam in similar furnaces, in place of the iron retorts, whicb, taking accidental bursting into consideration, suffer more loss than one-half of one per cent. Of course, analysis is inconvenient, and not fit to confirm 99½ p. c.; but 1 to 5 pounds of ore retorted, that is the thing; "it will come near the truth" (how near?)

The same objection which Mr. Knox puts forth in reference to unreliable average assays of large quantities of quicksilver ore might be applied with the same reason to silver, copper and other ores, and if he does not believe in the correctness of assays on small samples, he is now in the same position as many prospectors were ten years ago, who insisted on assays of at least five pounds of silver ore iu order to come near the truth.

If only one-half of one per cent. is lost, consequently nothing left in the furnace, there could be no obstacle in putting through 50 or 100 tons of ore as a trial. Treat the ore in the same way for sampling as is done with thousands of tons of more precious metals than quicksilver is; have correct assays made; compare the results of working with tbe amount shown by the assay, and you will find tbat a loss of one-half per cent., as well as the graciously admitted 5 p. c., is nothiug but a fiction, no matter what the bricks of the furnace or the debris of the ore show. G. K.

The Proposed Bear River Tunnel.

EDITORS PRESS:—In the PRESS of Sept. 27th, you publisb an article on this subject, signed "W," Oakland, Sept. 13th, in which some statements arc made in regard to the proposed American and Bear River tunnel, which I think, in justice to all partiee concerned, should be corrected.

Now, I have no personal interest iu this thing more than to state some common-sense reasons in the premises, and also to show tbat the writer (W.) has not the slightest knowledge of what he is writing about. I have been a miuer in this immediate sectiou of Bear River for twenty-two years, and I flatter myself that I have at least common intelligence, and am prepared to make a practical statement, as I understand it.

In the first inetance I will venture this assertion, that there is not a practical miner in the whole vicinity of Bear River, Steep Hollow or Greenhorn Creeks, (which are the streame proposed to be drained), but who will endorse what I say, wbich is, tbat it is a perfectly feasible and practical tbing, and that it will pay, provided the cost is no more than now estimated by practical engineers; that being $600,000, for running the tunnel from Bear River to the American, a distance of a little over two milee.

Now, admitting the first proposition of "W." that to run a tunnel through solid rock 12,540 feet, is no small undertekiug, and then flume it with a 12 foot flume, which, of course, is a necessary tbing, of course it will necessitate a large expenditnre of money, probably more than the estimate made. But the point I wish to make is this, tbat "W." bas not stated the plan correctly, for no one ever proposed to give a flume 6 inches to the 12 feet grade; if they did tbey were not practical minere. Four inches grade to 12 feet is sufficient, and more than that with the body of water tbat will have to pass through the flume would certainly be a detriment. All those streams mentioued bave 4 inches fall to the 12 feet; that fact bas been demonstrated time and again by surveye. Now, if you set a flume in the river giving it 4 inches to 12 feet, any one can see that it exactly fills the bill, for it will keep right along on tbe bed rock just as far ae you desire to run it.

And now, about another thing; W. says that Bear River had an ordinary sluice grade, tailings would not have accumulated to the extent they have. This is a foolish assertion; but I will venture to say, that had a flume 16 feet wide and 6 feet deep been placed in Bear River and kept in running order before those tailings commenced to be run in, and a tunnel had been opened into the American, tbere would be no tailinge in Bear River to-day.

The reasons of those tailinge being there are very p'ain. One is that the Auburn Ditch Company have a dam where the proposed tunnel intersecte Bear River, 17 feet bigh, tbat would certainly make them back up that high; and in doing that, would not it make the river a great deal wider and of course, less of tbem pass away. Now, about tbe amount of gold and quicksilver in those streams; I don't pretend to know what quantity there ie, bnt I was a miner in those streams before those tailinge from the hills commenced to come in, and know that they were good paying streams, and I will venture the assertion, that not one-tenth of the gold was taken out before the tailinge came in and drove the miners out. My knowledge of the minee in this immediate neighborhood justifies me in the conclusion that there is gold enough in these streams to pay the expenditure estimated for the tunnel. All the hundreds of tons of quicksilver that have been brought here, with the exception of tbe small stock now on hand, have passed away iu those streams, and why not a great portion of the gold with it? M.

Little York, Sept. 28.

Troy District.

This district, situated in the White Pine range, about eighty milee south of Hamilton, is showing a very marked improvement since the return of Mr. Davies from his visit to England on business of the Troy Silver Mining Company, limited, of which he ie the managing agent. Notwithstanding the discouragements which the company have met with, from many adverse circumstances, they have increased the capital to the extent of about $400,000, and are determined to prosecute its enterprise for the production of silver. The company have a number of valuable ledges, upon the principal part of which work ia being pushed with great activity, employing about 40 bands. The mill and Stedefeldt furnace were started up about the first of this month, and we learn from Mr. Davies thst it had been his intention to make the first clean up on Saturday last. We are unable at present to state the result of the run, but will probably learn how succesaful or otherwise it has been, on tbe arrival of the stage due this afternoon. The difficulty with tbe workings of the ore heretofore, has been on account of the large percentage of zinc blend and copper which it carries. The large percentage of silver contained has encouraged further experiments to obtain bullion of satisfactory fineness, which it is to be hoped have already proved successful as the Troy Company, incorporated in Lancasbire, England, has proved itslf one of the moet resolute and liberal of the many foreign organizatione that have contributed to the development of the bnsiness of silver mining on thie coast.—*White Pine News.*

Silver Coinage.

A few days ago we published an article in the *Call*, having reference to the deprcciation of the value of silver bars, and urging the coinage of silver by the Mints, with a view to ite entering more extensively into circulation in the United States. There is no reason why a country which produces large quautities of silver should take steps to depreciate its value, particularly when so much is needed to aid in stimulating manufactures, agriculture and commerce. There is required in the United States two or three hundred million dollars of silver coin, and hereafter it will be found neceesary to regulate its issue with more care than ever before. As was etated a few daye ago, we have silver coin ranging from five to fifty cents in nominal value, but really worth, in comparieon with gold coin, from one to two per cent. less.

The laws under which silver is coined at our Mints should be at once changed. The coin should be increased in weight so as to equal gold coin, dollar for dollar; and as the gold dollar is unpopuiar and going out of use, a eilver dollar should take its place. As there is no probability of the world ever being over supplied with gold, it is believed it would be well to consider the propriety of using no gold coin of less value than five dollars. Certainly, we should have no gold coin of less value than two and a balf dollars. If the general Government would enact laws properly arranging our monetary system, there would be no danger of depreciation in the value of silver for many years to come, and probably never, for the rage which now runs to gold would be modified by other countries adopting more extensively silver coinage, in imitation of ourselves. In California we need silver coinage equal in value to gold. We desire to see a handsome dollar—one wbich is worth a dollar. California could as well as not use some millions of silver in addition to what she now circulates. Nevada would be pleased to have an addition to her currency in the way suggested, and so would the whole Pacific Coast; hnt we do desire to be rid of the half dollars wbich must be sold at from one to two per cent. discount. California can certainly stand a full-value silver coin, as a legal tender in amounts up to one hundred dollars—possibly more. If California can use silver, why cannot the other portions of the country? It will require a large amount of coin to reeume specie payments throughout the States on the other side of the continent. It will be difficult to fill the void with gold. Why, then, ehould not silver be used extensively there? The people would be as well pleased with silver dollare as with gold coin, possibly more so than with small gold coin.

At any rate, witb silver dollars of full value, made a legal tender for eums as high as one hundred dollars, steps would be taken beneficial to the people, and et the same time much would be done to absorb the silver turned out of our mines. The inhabitants of this coast ehould make an effort to have silver enter more extensively than it does at the preeent time into the monetary eystem of the country. It was well enough, perhaps, when our eilver coin was debased in imitation of the English system, for then silver wae scarce and gold wes plentiful. Now the gold supply is diminishing and the silver increasing. The situation of the United States in respect to the two metals has changed entirely. Why, then, should not our laws change to suit tbe altered position? By raising the standard of silver coins, every State on this side of the continent would be benefited. Nevada would be greatly benefited, and this would be advantageous to San Fraucisco. In the Eastern States the benefits to accrue to the people would be even greater than those conferred upon ourselves, for it would aid in a resumption of specie paymente by the banks. At the present time in Europe, the tendency is to use gold coinage. Silver has been discarded, for the same reasons which induced a change in the United Statee. The diminished supply of silver and increased production of gold brought about the result. It is not unlikely that a reversal of the situation will ultimately induce other countries to turn to silver again to help them out. With the multiplication of railroads, steamers and telegraphs, which multiply the interchange of commodities, an increase of money becomes a necessity. And to give stability to paper money, an increase of a metallic basis becomes necessary, and this must he obtained by placing silver coinage on a better basis.—*Call.*

PUDROLITH.—A new kind of explosive ia made by mixing equal parts of apent tan, sawdust, nitrate of potash, nitrate of baryta, charcoal and sulphur.

MECHANICAL PROGRESS.

Submarine Blasting.

A series of interesting submarine blasting operations in the Schuylkill river are now in progress, having for their object the removal of rocks which impede navigation. Two months ago work was commenced at a point where 800 cubic yards of rock had to be removed so as to make the channel 19 feet deep at low tide. Three kinds of rock were found—one of soft mica, another of feldspar and quartz, very hard, and the third of a hard, dark sandstone. To remove these rocks, holes 3¼ to 4 inches in diameter, and 5 or 6 feet apart, were bored to the required depth, which varied, of course, with the size of the obstruction. Burleigh's steam drill was used. This drill, which is a compact form comprises an engine and the drill proper, is mounted on a tripod with telescopic legs, to conform to the irregularities in the bottom of the river. Steam is supplied through a flexible hose from a boiler on the workman's scow, and the drill is made to give from 150 to 200 blows per minute. The drills are from 16 to 18 feet in length, rose bitted, with four lips of cast steel from 3¼ to 4 inches in diameter. The drill is connected directly with the piston of the cylinder, and is given two motions, perpendicular and rotary. It is self-feeding, and as the work proceeds, the cylinder of the engine follows the drill, thus allowing a play of about 3 feet with each one of the drills of different lengths. The holes are bored from 3 to 11 feet deep, and with this machine about 18 feet are bored each day. Water is pumped into the hole made by the drill during the operation to wash out the sediment, and, when completed the holes are plugged up by a diver, a rope connecting all the plugs and guiding him to the several holes. The diver is dressed in an india-rubber suit, with copper helmet and breast-plate, lead shoes, and heavy weights are fastened to his side. The shoes have leaden soles, and weigh 60 pounds. The helmet weighs 80 pounds, the sinking weight 200 pounds, and the suit about 40 pounds, so that the diver carries 380 pounds into the water. Few men can bear the load in ascending and descending, but in the water the weight is not felt, and the diver can work at the bottom of the river for many hours without extraordinary fatigue. The copper helmet is very large, and has three glass windows in it that look like the port holes of a ship. When these are closed the diver's only supply of air is from an india-rubber tube into which air is continuously pumped by two men. The air circulates about the man's head and escapes at the back, but any stoppage of the supply would result in almost instant death. The diver first sets the drill in position, then returns and plugs up the hole, again returns, withdraws the plugs, and puts in place thereof dualin cartridges, and after the blast has been made, again descends to put chains around the heavier rocks, that they may be lifted out of the river. The advantage of using dualin instead of powder is that, as a general rule, it reduces the rock to powder, or breaks them up into such small pieces that they can be removed by means of the dredger. The dualin cartridges used are from 4 to 8 inches in length, and sometimes several are used in one hole. They are fired off by means of an electrical battery, to which is attached an insulated line terminating in metallic fuses fastened inside of the cartridges.—*Iron Age.*

Fabrication of the Paper for Greenbacks.—All the paper used to print the national currency on, is made in the Glen Mills, near Westchester, Pa., by a 62-inch Fondrinier machine. The principal peculiarity is that short pieces of red silk thread are mixed with the pulp, and this is poured on the wire cloth, without going through a sieve, as this would retain the threads. Next, from a separate contrivance worked in a very peculiar manner, a shower of short blue silk threads falls in strips on the paper while this is in the process of formation. One side of the paper is thus covered with blue lines, formed by the blue silk thread; and this is used for the front of the greenback, on which these threads are distinctly visible, conform to the manner in which they were superficially distributed, notwithstanding they are deeply enough embedded in the texture of the paper.

The peculiarity of this machine is to make a paper so peculiar as to be practically impossible to imitate; and this is one of the principal guarantees against forgery in the possession of the government. We need scarcely mention that this paper-making machine is night and day under the charge of Treasury employés.

An English exchange describes a new process of coating metallic articles with tin, zinc, etc., as follows: In coating with tin, according to this invention, oil or fat, together with chloride of zinc, are placed in a heating pot having a rotary or oscillatory motion, and when the fat or oil is sufficiently heated the pins and metallic tin are thrown into the pot, which is turned or oscillated for a few seconds. The pins are thereby coated with tin, and are raked out of the pot into a vibrating riddle or sieve, through which they fall into water. Or a tubular pot may be used, the pins being introduced in one end and removed at the other end, the pins being carried through a rotary pot by a screw-like motion effected by a screw-like rib in the interior of the pot.

Sheathing Iron Ships.

Two of the most effective methods of sheathing iron ships, at present in vogue, differ so peculiarly in their principles and details that the practical results of the two, based on actual experience, would furnish interesting material for comparison. In one of these, in which copper, mixed metal, or zinc, is employed, the inner layer of the iron skin consists of narrow strips of plate, merely wide enough to make lap-joints with the outer layer, and to have a groove between the edges of each pair of outer plates, about as wide as the plates are thick. Into this groove is placed a filling of teak or ebonite, a compound of india-rubber and sulphur. Outside the plating is a layer of tarred felt about one quarter of an inch thick, upon which the sheathing is laid and fastened with sheathing nails of the same metal, driven through the felt into the filings. Intermediate fastenings are obtained, in case of their being found necessary, by inserting ebonite plugs into the holes drilled in the iron plates and driving sheathing nails into them. In the other method, outside the iron skin are riveted angle iron ribs, the projecting flanges of which are dovetailed in section. The inner skin is coated with pitch, and the spaces between the dovetailed flanges are filled by packing and wedging into them short pieces of plank. The outside ribs, with their wooden filling, rise to a short distance above the water line, and the upper edge of the filling is guarded by a longitudinal angle iron. The outer surface of the filling having been paved with pitch, a complete wooden sheathing, about one-and-a-half inches thick, is put on and fastened to the filling pieces with mixed metal nails, but not passing through these pieces. This is also pitched, and then sheathed with copper or mixed metal, care being taken to keep the metal sheathing two or three inches from any exposed piece of iron.—*Stove and Tin Trade Journal.*

Messrs. Wilkinson & Taylor, of Birmingham, have lately invented an improvement in apparatus for casting metals, which is well spoken of. The invention consists of machinery or apparatus to be used for casting long or continuous ingots, bars or strips of metal, to be afterward rolled into plates or drawn into rods or wires. The apparatus consists essentially of a nearly vertical traveling or endless mould, composed of two series of endless bands of jointed plates, supported by and working over drums or pulleys. The plates of one series are of a trough form, open at both ends, and the plates of the other series are flat. The two series of endless bands of jointed plates, are so arranged with respect to each other that in their descending motion they are brought together and constitute an endless mold, and in their ascending motion they are separated from one another. The flat plates are pressed into close contact with the trough-shaped plates by springs. The two series of plates are geared together and worked by racks and pinions. In using the machinery a temporary bottom is fixed in one of the trough-shaped plates, and motion being given to the endless bands of jointed plates, molten metal is poured into the apparatus through a funnel fixed at the highest point of the machine. The ingot or bar formed by the solidification of the metal passes out at the bottom of the machine, the temporary bottom of the mold passing out in front of the ingot or bar.—*Ex.*

A Time Recording Clock.—A clock has been invented by an officer of the Western Union Telegraph Company, which at any time will print the year, month, day, hour and minute. It acts either automatically or by hand, as may be desired. This time-printer is worked by an electro-magnet. Use does not impair or affect it as a time-keeper. Behind the dial, which is of glass, and indicates the time, there is an adjustment of wheels and machinery connected with a small battery, and above all a small press, in appearance such as is usually used for cancelling stamps, receipts, and like purposes. By placing at any hour of the day a slip of paper beneath the face of what appears to be an ordinary die, and pressing down the handle, there will appear instantaneously, printed in clear type, the year, month, day, hour and minute when it was done. This acts automatically, needs no regulation, is always correct, being connected with the chronometer which is regulated by the Washington Observatory, does not get out of order, as there is no friction, and it is about to be put into general use. The whole apparatus is not larger than an ordinary mantel time-piece, and is easy to handle. Its advantages are manifold. It is to be used by persons in charge of railway stations, who will be required to obtain an impression of the hour when trains arrive, pass or leave the depot, thus tending to prevent accidents, and to hold the different employes to rigid responsibility, and placing the blame of failure in duty or accidents upon the proper persons. It will secure vigilance on the part of watchmen, who will be required, at intervals during the night, to obtain impressions from the electric time-keeper, and thus give evidence of their fidelity to their trust. It is not possible to manipulate the machine so that it will record other than the correct time, and is a faultless sentinel of the passing hours.

Material for Gas.—An English stearine company has brought into market a new material for manufacturing gas, called vegetable pitch, obtained from the purification and preparation of certain vegetable oils. This substance gives a gas of great illuminating power, and will be particularly useful when mixed with the coal now used in gas-works.—*Artisan.*

Suppression of Sewer Gas.—*Iron* gives the following account of a new apparatus, known as the Redcliffe Sanitary and Ventilating Trap Composed of stoneware, glazed inside and out, it is not liable to corrosion, which is a palpable advantage. Its shape being that of a very large-sized egg, it admits of no projecting corners to prevent the free passage of any matter going through it to the sewer. It holds about four gallons of water (more than any of its rivals); its diaphragm dips three inches into the water and is hermetically sealed to the underside of the top, so forming a powerful resistance against sewer gas passing that point. The internal conducting pipe which is connected with the soil-pipe from the closets, etc., above, bends under and discharges its contents into the body of water in the trap well below, and beyond the diaphragm on the sewer side, to prevent soil or gas re-entering the soil pipe and escaping thence to the house. There is also an excellent arrangement in the crown of the trap for complete ventilation through a distinct pipe which is carried to the top of each house, and which has only that function to perform. A second inlet, also trapped, takes the waste water from baths, sinks, etc., thereby thoroughly cleansing the apparatus, arresting smells of every description from passing into those parts of the house, or into the waste pipes from cisterns, and, in fact, completely checking the inroads of sewer gas. The trap is moderate in price and is easy of application to existing systems.

SCIENTIFIC PROGRESS.

The Nebular Hypothesis.

In the year 1811, Sir W. Herschel announced that he had (as he supposed) detected changes in the Orion nebulæ. The announcement appeared in connection with a very remarkable theory respecting nebulæ generally—Herschel's celebrated hypothesis of the conversion of some nebulæ into stars. The astronomical world now heard for the first time of that self-luminous nebulous matter, distributed in a highly attenuated form throughout the celestial regions, which Herschel looked upon as the material from which stars have been originally formed. Few theories have met with a stranger fate. Received respectfully at first on the authority of the great astronomer who propounded it—then in the zenith of his fame—the theory gradually found a place in nearly all astronomical works. But, in the words of a distinguished living astronomer: "The bold hypothesis did not receive that confirmation from the labors of subsequent inquirers which is so remarkable in the case of so many of Herschel's other speculations. It came to pass at length that the theory was looked upon by nearly all English astronomers as wholly untenable. In Germany it was never abandoned, however, and a great modern discovery has suddenly brought it into general favor, and has in this, as in so many other instances, vindicated Herschel's claim to be looked upon as the most clear-sighted, as well as the boldest and most original, of astronomical theorizers.

The time came, however, when a new instrument, more telling even than the telescope, was to be directed upon the Orion nebulæ, and with very startling results. The spectroscope had revealed much respecting the constitution of the fixed stars. We had learned that they are suns resembling our own. It remained only to show that the Orion nebulæ consist of similar suns, in order to establish beyond all possibility of doubt the theories which had been so complacently accepted. A very different result rewarded the attempt, however. When Dr. Huggins turned his spectroscope toward the great nebulæ, he saw, in place of a spectrum resembling the sun's, three bright lines only! A spectrum of this sort indicates that the source of light is a luminous gas, so that, whatever the Orion nebulæ may be, it is most certainly not a congerie of suns resembling our own.—*Popular Science Monthly.*

Purification of Animal Charcoal.—The purification of bone black is an important operation in the arts, and the ordinary charcoal sold is generally far from possessing the degree of purity required; its power of decolorization is relatively weak, and it generally contains a certain amount of sulphate of lime, which becomes dissolved in the liquids to be freed of color. M. Grœger, a French chemist, gives the following receipt for producing pure charcoal. After is pounded or ground, boil it with five or six times its own weight of water containing 4 to 5 per cent. of carbonate of soda; let the mixture stand for four days, pour off the water, and treat the charcoal with the ordinary hydrochloric acid of commerce. The charcoal must then be heated, and the acid treatment repeated until the liquor is unaffected by ammonia. Much more acid is required to be used than is generally supposed to affect this purification. The charcoal must be well washed by decantation with a large quantity of water, and then with distilled water by filtration; and, finally the charcoal must be dried at a temperature of 100° to 120° C. By this process, 100 parts of raw charcoal will yield 20 per cent. of purified, the latter forming a light, friable powder, possessing an intense decolorising power, and producing the effect desired with a relatively small quantity, facts which will recommend themselves to all practical minds.

Iron in Snow.

We condense as follows a letter from Dr. Nordenskiold, the great northern traveler, communicated to the Academy of Sciences by M. Dauhrée. It is dated Mossel Bay, lat. 79 degs. 53 mins., September 9, 1872, and arrived at Tromsoe on the 29th July last. The writer states that in December, 1871, the largest fall of snow within the memory of the oldest inhabitants was experienced at Stockholm. It lasted for five or six days, and caused the loss of several lives in the country round Stockholm. Judging that the impurities of the atmosphere must have been swept down during the first days, the writer carefully collected some of the snow corresponding to that period and melted it, to see whether any solid parts were contained in it. He found it charged with a considerable quantity of black stuff resembling soot, but in reality consisting of organic matter, rich in carbon. It also contained small particles of metalic iron, and altogether recalled to mind the meteoric dust which fell at Hessle, near Upsal, on the first of January, 1869. Suspecting the chimneys of the city to have supplied these materials, he wrote to his brother, Carl Nordenskiœld, in Finland, begging him to repeat the experiment. The latter did so, taking the snow from under the trees of a forest, at a distance from all inhabited places, and found the same black matter in it, of the same nature as that at Stockholm. Small iron particles were extracted from it with the magnet. After repeating these researches in various parts of Sweden, the writer had the long sought for opportunity last year of continuing them in the Arctic latitudes. A floating sheet of ice covered with snow gave him the chief material in a state above all suspicion of terrestrial contamination. Its fusion yielded a gray residue, consisting of fragments of northern plants and metalic iron. It would seem, therefor, that the latter must be of cosmic origin.—*Iron.*

Assay of Lead.—We find in *Iron*, of September 13th, the following method of assaying lead ores, which depends on the reduction of this metal by means of nascent hydrogen. On account of the impurities present, it is needful, as preliminary, to convert the lead into sulphate.

The ore is mixed with twice its weight of dry sulphate of ammonia, and the mixture is heated in a crucible, which is covered to obviate loss by projection. It is heated at first moderately till all ebullition has ceased, and the temperature is then raised to full redness. After cooling, the mass is dissolved with the aid of heat in water acidulated with sulphuric acid, to which a few drops of hydrochloric acid have been added. The copper and the iron present are thus dissolved, while the chlorine prevents the solution of the silver. The insoluble portion, containing all the sulphate of lead, is collected on a filter, washed with hot water, dried in a porcelain capsule, and the paper is burned to ashes. To the dry residue is added twice its weight of zinc in fine powder, and the whole is introduced into a flask, into which hydrochloric acid is gradually poured. The reduced metal is then washed either in water freed from air by boiling, or in acidulated water. The mass is then united together by pressure, and placed in a crucible, where it is dried. It is then mixed with 1½ to 2 parts of Plattner's flux (carbonate of potash, 13 parts; dry carbonate of soda, 10 parts; fused borax, 5 parts, and dry starch, 5 parts); the whole is covered with a layer of the same flux, and fused gently until the melted mass is perfectly tranquil. The regulus is then weighed. The zinc employed must, of course, be free from lead; if no pure zinc can be procured, its amount of lead may be previously determined.

Cold.—That very convenient chemical, the solution of chloride of calcium, is equal to either fortune. Refusing to boil except at a very high temperature, it has been used extensively in the production of "tinned beef." Reduced to a temperature that would freeze almost anything else, it acts as an admirable handmaid to ammonia, and assists in freezing large quantities of Australian beef for the home market. The cattle are killed in a frozen slaughterhouse, are kept down to a low temperature and are shipped and preserved in that condition until the meat reaches England. How the meat is kept at a low temperature while in the ship is a mystery not yet divulged, but it is easy to divine that a small ammonia machine on board would produce all the cold necessary, and it is also possible to conceive that the meat being once properly frozen might be packed in air-tight tanks, carefully hedged in by a non-conductor. Speculation would be premature, as the first shipment of Australian beef preserved by the chilling process is now on the road to England, and the value of the new system will soon be tested by actual experiment.

Sulphozone.—Under this strange name is sold a mixture of flowers of sulphur and sulphurous acid, invented by a Mr. Roberts. This preparation is considered four or five times as effective in destroying aphidea, blight, &c., upon plants, as the unmixed flowers of sulphur, and requires to be used with caution.

THE *London Times*, which hae beeu sued by Ruhery for £5,000 damages for libel, because that paper mentioned his uame in counection with the Arizona diamond swindles, has determined to fight it out and prove its assertions. A lawyer has been sent to this city and a commissiou appointed to take testimony for use at the trial in London. It is to he hoped that this investigation will amouut to something and that the names of the guilty parties will be exposed.

The exact number of railroads in the United State at the present time is 425; miles of railroads, 57,323; cost, $3,159,423,957; cost per miie, $54,116; gross receipts, $373,241,055; operating expenses, $307,486,982; net earnings, $165,754,373; dividends paid, $64,418,151.

OUR NEW MINT.— Coining machinery has already been shipped from Philadelphia for the new San Francisco mint, and the contract hae been awarded for the construction of engines, boilers and shafting. It is snpposed by the Directors of the Mint that operations will be commenced about the 30th of June next; in the meautime, coining will go on as heretofore, with the present facilities.

ABSOLUTELY pure iron is said to have heen produced by a Russian chemist by meaus of a galvanic battery. During the process a large quantity of hydrogen was disengaged from the ordinary irou used. The pure iron is a silver white metal, very malleahle and ductile, and so soft as to he readily cut with a pair of scissors. It ie very different from iron which has heretofore been supposed to be pure.

Our Weekly Stock Review.

THURSDAY EVE., Oct. 9th, 1873.

The stock market this week has not been very active, but it has shown some improvement over the previous week. Ophir, which has been finctuating considerably for some time past under the influence of conflicting reporte, has leviedan assessment of $5 per share, delinquent on the 11th of Nov. Many are eanguine that something will shortly turn up in Ophir, and others think the prospective developments are only a "put up job." As rich ore developments may be expected at any time on the Comstock, the public are always on the lookont for the miue which shows any chance of finding them.

The Consolidated Virginia Compauy have called a special meeting, to be held on the 18th inst., to take into consideration the propriety of increasing the capital stock from $7,080,000 in 23,600 shares to $10,800,000 in 108,000 of a par value of $100 per share. The Trustees of the mine are S. Heydeufeldt, B. F. Sherwood, Wm. S. O'Brien, J. C. Flood and Edward Barrou. If the stock is increased as expected, Consolidated Virginia will have more shares than any of the stocks on the list of the Board, Belcher now being the highest with 104,000 shares. The compauy have made extensive additions to ther mine, in the shape of hoisting works, ore houses, etc., and are well prepared for a systematic working of the mine. If they ever strike that ore body, as they hope to do soon, the miue will come on the dividend-paying list.

The Golden Chariot stockholders will hold a special meeting on the 20th about their capital stock. They propose to increase from $1,000,000 in 10,000 shares, to $3,000,000 in 30,000 shares. The Trustees are A. J. Bryant, H. Mayers, G. L. Bradley, A. H. Rutherford, W. J. Williams and J. M. Martin.

The decision of the surveyors who are to decide the dispute hetweeu the Belcher and Crown Point mines has not yet been given, although the surveys have been completed. It will be remembered that the Belcher is charged with having beeu taking out ore from a piece of ground seven feet wide which belonged to the Crown Point miue, and the surveyore are engaged in determining whether they have or not. The amount claimed is variously estimated at from $400,000 to $800,000. Both these mines are turning out hulliou as usual, though the low stage of the water in the Carson river retards the progress to some extent. For the year 1872, Belcher produced $4,794,659 in gold and silver, of which $3,087,948 were in gold. Those who are in the habit of classifying these big mines among the silver minee exclusively will be rather astonished to see a yield of only $1,706,710 in silver from Belcher, as against $3,087,948 in gold. The proportion of metals iu Crown Point for a year was: silver $3,587,189, gold $2,826,458, a majority in favor of silver of ahout $700,000. The production of Belcher for the first eight months of the present year is $7,260,328, with a cash surplns on hand September 1st of $300,000. From the 1st of May, for the four months succeeding, Crown Point produced $2,750,264, and had a surplus on hand September 1st of $500,000.

Raymoud & Ely has passed its dividend this month. Litigation is keeping this mine in the back ground badly. It is under honds of $1,000,000 now, and, as the bondsmen naturally want eome security, all the receipts and assets are retained and no dividends paid. The suit comes off on the 15th. The bullion shipped in September amounted to $168,998.

Belcher has announced a dividend of $3 for the month, aggregating $312,000, and carries over 400,000 to next mouth's accouut.

The Crown Poiut divideud for the month ie also $3 per share, and equals $300,000.

Eureka (Grass Valley) pays this month $2 per share, instead of $1, as usual, which equale $40,000. The last clean-up of two daye' run was 337 onnces of amalgam.

The Chollar mine yielded in Septemher $43,637.70. They have on haud at the mill 7,573 tons of ore waiting to be crushed.

The Minnesota sent down two bars on the 1st inst., valued at $6,125, and the Mahogany sent $2,152. The shipments from the latter in September aggregated $27,000.

A NEW PROCESS for the manufactnre of steel is reported as follows: A mixture of pig iron and powdered ore is cast in convenient moulds and heated in a special furnace at an active red heat. Ingots of crude steel are said to be thus formed which can be melted in crucihles or a furnace.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

A Fine "Brick."—Alpine *Chronicle*, Sept. 27: We were shown at the Exchequer Mill, a "brick," of 977 fineness, weighing 302½ oz., and valued at $464.18—silver, $376.64; gold, $87.54. A result of three days' run on refuse ore.

Attached.—Sheriff Scott this week attached the Globe Mill, mine, hoisting works, etc., at Monitor, for $1,500 due Matthew Nettle.

AMADOR COUNTY.

Kennedy.—*Ledger*, Oct. 4: The recent discovery in the Kennedy, loses none of its importance as work progresses.

The Oneida.—This mine is giving flattering evidences of prosperity. It is upon the great "mother lode" and when the works, now under way, shall be completed, we can calculate upon seeing the Oneida rank among the most valuable paying mines of the county.

Sulphuret Works.—We paid a visit to the new Sulphuret works now in process of construction a short distance north of the Lincoln mine. The carpenters are busily engaged in roofing in the buildings, and the masonry of the furnaces is being completed as rapidly as circumstances will permit. The machinery is now at Galt, awaiting transportation.

The Lincoln.—Sutter Creek *Independent*, Oct. 4: Work is being pushed forward rapidly at the Lincoln mine, and the results are very satisfactory. A winze is being run from the 500 to the 300 ft. level, which will be the means of securing an excellent ventilation. The mill is at present working upon ore from the 300 ft. level, at which point there is a very large body paying $15 per ton. Some specimens would assay at least $500 per ton. Adjoining the main shaft on the south a new 6 ft. shaft is now approaching completion, in which, will be placed a bucket and pump. An additional engine is rendered necessary, which will soon be placed in position. It is expected that in about two months the new shaft, with its appliances, will be in working order. The reports from the Lincoln mine are of the most favorable character.

Amador Mine.—At a depth of 1,570 ft. the ore vein is wide and rich in quality, and it is now an undoubtable fact that the quality and quantity of the ore increases as a greater depth is reached. The deepest, and one of the richest gold mines in the world, the Amador has before it a brilliant prospect.

Mahoney.—The discovery in the Mahoney mine is said to be valuable, and, to all appearance, permanent.

Alpine.—From Plymouth comes encouraging news. This mine continues its flattering promise, and we are pleased to learn as work progresses the rock increases in quantity and richness.

State of Maine.—Work steadily progresses on the State of Maine mine, situated near the Butte mountain, with flattering prospects of final success.

River Mining on the bars of the Mokelumne River, is being carried on to a very considerable extent, and, in many instances, with profitable results, the water in that river being lower than at any period within the last twenty years.

CALAVERAS COUNTY.

Goon Rock.—Calaveras *Chronicle*, Oct. 4. Fifty tons of quartz, taken from the Haskins mine at West Point, lately yielded $2,800—an average of $56 per ton.

The Rising Star Claim.—Work on this claim progresses favorably, gold being visible in the dirt. The tunnel is being run up the center of the lead. The drifting being done on the side of the main tunnel is showing that the pay streak extends clear across the channel.

Spring Gulch.—Moser & Co. are making active preparations for the Winter campaign. As soon as the rains set in, operations will be commenced upon a most extensive scale. The gravel in the gulch has been immensely rich, and there is no doubt but that a very large sum of money will be taken from the claim the coming season.

Bartolo.—We learn that first grade ore is being taken from the Bartolo mine in large quantities. Since its consolidation with the Ohio, the Bartolo has been systematically worked, and the mine is making a splendid showing.

EL DORADO COUNTY.

Important Sale.—Mountain *Democrat*, Oct. 4: The South Fork Canal Co. have conveyed to the El Dorado Water and Deep Gravel Mining Co., all their canals, ditches, water rights &c. and also, the Excelsior mining claim, which belonged to the former company.

We also understand that Bishop & Kirk conveyed to the latter company all their ditches, water rights &c., so now that all conflicting titles heretofore existing are merged in the new company. The consideration to the South Fork Canal Co. is $60,000 for the canal, and $75,000 gold coin for the excelsior claim. A new and large canal is to be constructed; the lakes in the mountains which now serve as feeders for the canal are to be dammed up, and the water retailed for summer use.

FRESNO COUNTY.

Ne Plus Ultra.—Fresno *Expositor*, Oct. 1: This company is taking out some excellent ore. How extensive the deposit is has not been fully determined. If cheap transportation could be obtained, our copper-mining interests would flourish.

INYO COUNTY.

A Big Strike.—Inyo *Independent*, Sept. 27: Superintendent Wingard of the Silver Sprout is convinced now that he has a valuable mine. They struck on a superb body of ore, full 6 ft. thick, in the lowest workings of the Silver Sprout, the other day, and this, in connection with previous developments in that and adjoining ledges, is deemed amply sufficient to justify immediate and systematic working of the mines and reduction of the ores at the mill belonging to the Company at the foot of the cañon, or its removal to a more accessible location near the mines.

Bullion Shipment.—Sept. 24, from Lida Reduction Works, 18 bars fine bullion, valued at $2,422.

NEVADA COUNTY.

Omaha Mine.—Grass Valley *Union*, Oct. 5: The shaft of the Omaha is down 100 feet, and cannot go any deeper with the power now used there for hoisting and pumping. A level has been run from the bottom of the shaft a distance of 100 ft. toward the south. The ledge in the shaft and in the drift is something over a foot thick and shows well.

Repairing.—The Eureka mill will be stopped for a few days of this week. New pumping rods are being put into the mine and a new cylinder for the pumping engine is to be put in place. These necessary repairs are being hurried up.

PLACER COUNTY.

Auburn Mine.—Placer *Argus*, Oct. 4: From Dr. Manson, Superintendent of the Auburn mine located on Rock Creek, about four miles from Auburn, we learn that the company have commenced the erection of steam hoisting works, in place of the works destroyed by fire a short time since, which was run by water power. The main shaft is now down 240 ft., and a drift is being run at that depth, which is now in about 75 ft. The ledge in the lower drift is from three to five ft. thick, and is all good milling rock.

SHASTA COUNTY.

Iron Mines.—Shasta *Courier:* Mr. Potter, in behalf of the Iron Mining Co., has secured the extensive deposit of ore situated on the McCloud river. It is estimated that millions of tons of good paying iron ore can be taken from the surface of the ground claimed by the Company, and that the expense of taking it up from its original place of deposit will be very trifling. The Iron Company have done work enough on Iron Mountain above Shasta, to entitle them to hold the ground and apply for a patent for mineral land, and it is their intention to do so.

SIERRA COUNTY.

Lone Pine Mine.—Mountain *Messenger*, Sept. 28: This mine is situated above Downieville, in Sierra County. Mr. Adams, of this place, one of the twelve owners, informs us that it is paying very richly. Pans of dirt pay all the way from twenty-five cents to eight dollars. A number of specimens have been taken out, one worth $45, another $15, and three or four worth $7 each. The quartz is very near the surface, and they can strike it almost anywhere by sinking four or five feet. The ledge contains much free gold and many specimens. About 12 or 15 men are now employed, but the force will be increased as soon as developments warrant.

TRINITY COUNTY.

Rich Ore.—Trinity *Journal*, Oct. 4: Mr. George D. Craig lately received a number of specimens of the rock sent to his father's office in San Bernardino for assay. Among them are some samples from the ledge lately found by Joe Voshay, which assay as high as $612.50 to ton.

TULARE COUNTY.

More Mines.—Visalia *Times:* A new mining district, reported to be equal in richness to the Panamint discoveries in Inyo county, has been located on the South Fork of Kaweah river. By-laws and boundaries have been established, and there is considerable excitement at Porterville.

Nevada.

ELY DISTRICT.

Meadow Valley.—Pioche *Record*, Oct. 5: The incline shaft, No. 3, has reached a depth of 974 ft. the bottom being 98 ft. below the ninth station. The rock in the bottom is quite hard, but works well. The west drift the ninth station is in 123 ft. The face shows a strong vein of quartz, carrying a little metal. Work has been resumed in the east drift from the eighth station. The east drift on the seventh level is in 604 ft. No. 5 incline has reached a depth of 816 ft., the bottom being 66 ft. below the fourth station. Work has been resumed in No. 7, and the west drift on the eighth level has been continued to a distance of 400 ft. from the station.

American Flag.—The shaft has reached a depth of 300 ft., where the eight station is being run west to connect with a winze.

Newark.—The Amador mill is still running on Newark ore.

Washington and Creole.—Work continues in the west drift, which has now run 600 ft. on the ledge, exposing the continuance of a regular fissure vein throughout. Two winzes, one east and the other west on the ledge in this drift are being sunk. The winze going to the eastward 65 ft., and to the west 55 ft. The ledge in the drift is 2 ft. wide, and contains a streak of paying ore 9 inches in width.

Hunn & Hunt.—The fourth station has just been made, at a depth of 463 ft. The shaft is perpendicular. Drifting on the ledge in both directions will be commenced immediately. The vein at the point where the shaft is sunk is almost vertical, and for the last hundred feet has been partly in the shaft.

Pioche West.—The vertical shaft has now been sunk to a depth of over 600 ft.

Raymond & Ely.—About 200 men are at present employed in the mine. The amount of ore taken out daily is 125 tons, all of which is shipped to the mill, by rail.

Chief of the Hill.—In the west drift, a distance of 16 ft. further has been run. A progress of 9 ft. has been made in the shaft, making the bottom 351 ft. below the Burke tunnel, and 500 ft. below the surface.

Pioche.—The new shaft was yesterday morning 292 ft. deep, a progress of 20 ft. having been made during the week. It is excellently timbered the whole way down. Teams began hauling ore to the Amador mill on Friday.

Louise.—The drift at the 200-ft. level is in 90 ft. The ledge is 15 in. in width, with some good ore mixed through it. A vein of very good ore, 5 inches wide, appeared in the ledge during last week.

Silver Peak.—The incline is now 316 ft. deep. At the bottom the ledge is wider than at higher points, and some very fine ore is in sight. A body of excellent ore has been opened in the east drift.

Spring Mountain Tunnel.—The work of sinking goes on steadily. A progess of 10 ft. has been made in the tunnel.

Chapman.—From the 240 ft. level the men are sinking a winze, which is now down 15 ft.

Portland.—The sinking of the shaft is continued. A depth of 300 ft. will be reached on the 15th of this month.

Amador.—The shaft is still being sunk.

Alps.—The south drift is now 375 ft. in length.

Pioche Phenix.—Sinking the shaft at the rate of 75 ft. per month.

Page and Panaca.—At a point south of the shaft and distant from it 600 ft., on the 360-ft. level, a winze is being sunk. It is now down 180 ft.

Spring Mount.—The workmen are still sinking the shaft.

WASHOE DISTRICT.

Crown Point.—Gold Hill *News*, October 4: Daily yield 350 tons of ore. The ore hreaste on the 1100-ft. level are looking and yielding finely. There is no change in the daily average yield of the ore stopes on the 1200-ft. level. The north winze from the 1300 to the 1400-ft. level is down 55 ft. and shows considerable improvement. The main south drift on the 1500-ft. level is in 175 ft., at which point a strong flow of water was tapped, that made it necessary to secure the face of the drift and suspend work until the body of water is drained.

Belcher.—No ore is being extracted from the 1300-ft. level at the present time, as the supply for the mills can be kept perfectly good without trouble from the other levels. The main incline is down 105 ft. below the 1300-ft. level, the rock in the bottom continuing to blast quite hard. The winze from the 1300 to the 1400-ft. levels is down 102 ft. still in high grade ore. The main south drift on the 1300-ft. level is in 380 ft., the face still in good ore. The north drift from the main incline on this level is in 80 ft.

Mint.—The main east drift at the first station is in 225 ft., the last 50 ft. in the ledge, which shows finely at this point. The main drift at the second station is in 220 ft. The main shaft is being enlarged by the addition of another compartment, and soon as that is finished, sinking the shaft for a new level will be resumed.

Rock Island.—The old tunnel has been cleared out and repaired to the back side of the main ledge, which shows some streaks and spots of fine ore. Preparations are being made for sinking a shaft lower down the hill, and the erection of hoisting works.

Caledonia.—The work of enlarging the shaft for a third compartment and the erection of new steam boilers are making good progress. Preparation for the new pumping machinery and putting in new and improved hoisting reels are fast approaching completion. The yield of ore from the 500 ft. level is rather increased, if anything, and shows a decided improvement in the quality.

Consolidated Virginia.—Cutting out for the third compartment of the shaft is nearly completed. The new hoisting and pumping machinery is all in place ready to start up as soon as the shaft is completed. The Gould & Curry damp is kept full of high grade ore that will mill from $175 to $200 per ton.

Arizona, Utah and Globe.—In explanation of our heading, we will state that what has heretofore been known as the Arizona and Utah shaft is being sunk directly on the line between the Arizona & Utah and the Globe claims, being owned conjointly between the two claims, each company paying one-half the expense of the hoisting works and the sinking. The main west drift at the 400-ft. station is in 80 ft. making excellent headway, the rock in the face working quite soft. It is expected that this drift will tap the main ledge in about 50 ft. more. Sinking the incline is making good progress, the ore showing steady improvement as the work advances.

Justice.—The raise from the main north drift at the 300-ft. level of the old works, is up 80 ft., still in good ore. Cross-cuts to determine the width and extent of the body have been started. The prospects in this part of the mine are certainly very flattering. During the week connection was made between the main south drift on the 400-ft. level and the Silver Hill, giving a fine circulation of pure air. A winze has been started near the south line to prospect the level below.

Empire.—The east cross-cut from the main south drift on the 1,700-ft. level, is still driven ahead with no indications of yet having reached the east wall of the ledge. The upraise from the 1,600 to the 1,500-ft. level, is completed, giving a fine circulation of pure air in that part of the mine.

Silver Hill.—Daily yield 60 tons of ore. There is considerable improvement in the ore body near the Justice line, developed by the main north drift at the first station. The raise in the south drift, first station, continues to show improvement. Connection has been made between the north drift at the first station and the south drift from the Justice, affording fine ventilation for that part of the mine.

Baltimore Consolidated.—Work in all parts of the mine is progressing as usual, with no change to note, except a steady improvement in the quality of the ore, developed upon the upper levels, and more undoubted indications of its extent and richness as it is prospected downward toward the lower levels.

Sutro Tunnel.—During the past week the main header has been advanced 35 ft., making its total length 4,447 ft. During the week the drift east from the bottom of shaft No. 1 has been advanced 32 feet east and 37 feet west, making the total length of drift on the line of the tunnel made from the bottom of the shaft 467 ft., and leaving but 218 ft. to be excavated before the connection is made between the main header and shaft No. 1. Total length of the tunnel, 4,918 ft.

Knickerbocker.—No work is being done in the mine at present, on account of the inability of the hoisting machinery to keep down the water and do the other necessary hoisting. Grading for the erection of new and heavy hoisting and pumping machinery is making rapid progress.

Sierra Nevada.—Daily yield 65 tons of ore. The ore breasts are being gradually extended to the north and west, further into the hill, and still continue to improve in both the yield and quality of ore produced. The mill is kept steadily running, crushing ore from the mine.

Overman.—Sinking the main shaft is making steady progress. The ore discoveries on the 100 ft. level, made mention of in our report last week, continue quite favorable to the development of a valuable body, though little has been done towards its development for the past five days, owing to necessary repairs and retimbering of the main drift.

American Flat.—Prospecting the mine through the lower level of the Baltimore shaft continues with the most flattering prospects of rich developments soon.

Yellow Jacket.—The several prospecting drifts and crosscuts on the 1500-ft level are still pressed vigorously ahead without change of interest to note.

New York Con.—Sinking the shaft is making steady progress, although the flow of water from the bottom gives considerable trouble.

Kentuck.—Extracting some ore from the old upper workings. No change of interest to report.

Succor.—No change of interest to report. Work in the new shaft is going on as usual.

Julia.—The water in the shaft is being steadily lowered by the hoisting machinery. The main south west drift, at the 900-ft. station, is in 150 ft., making excellent headway, the rock in the face working finely.

Imperial.—The main incline is down 175 ft. below the 1700-ft station, good progress being made, although the rock blasts quite tough and hard.

Gould & Curry.—The several prospecting drifts and crosscuts on the 1500 and 1600-ft. levels are still driven steadily ahead without any change of interest since our last report. The erection of the new steam hoilers is about completed.

Hale & Norcross.—Sinking the incline is making steady progress, the rock in the bottom working and blasting quite tough and hard. Prospecting the lower levels continues without change of interest to report. Daily yield 50 tons of ore.

Utah.

BINGHAM CANYON.

Shipments.—Salt Lake *Tribune*, Sept. 30: Ship 200 tons of ore daily, although many of the mines are not worked to one-fourth their capacity.

Ores in Demand.—There has been, and still is, a great demand for Bingham ores with a heavy percentage in lead and good smelting qualities, and prices are paid for these ores which smelters could not afford, were it not for mixing rebellious ores with them, bought from other camps at low prices.

Discoveries this Season.—Among the mines discovered this year and producing a good quality of ore is the Confidence lode. This mine is situated in the foothills, about 12 miles from the Jordan river smelters. It has a shaft over a 100 ft. deep, showing a vein from 2 to 8 ft. wide of good carbonate ore. About 200 tons of ore are on the dump, to be shipped on the completion of the railroad.

The Samson Mine.—This mine is worthy of note, as it shows a good vein and the ore is of good quality. It is situated about 1,000 ft. westerly of the Confidence and on the same belt with the famous Yosemite mine.

Phillips's Scheme for Blowpipe Analysis.

In ths appsndix to the eecond edition of J. S. Phillips'e "Explorers', Miners' and Metallurgists' Companion," now in press, is a scheme of blowpipe analysis for the benefit of amatsurs. The tests have been devised and arranged hy Mr. Phillips for ordinary men, so that they may know wbat useful elements are present in minerals, without having to ponder over and puzzls themselves with all the irregular and complicated lists of re-actions in qualitativs analysis, which can only be fully comprehended after long years of arduous practice and study. Mr. Phillips eays:

"Bcfore entering on the following course of tests, it will be necessary that the practitioner should be acquainted with, and be able to effect the various manipulations described in Chapter IV, of Section 3; as, how to produce the oxidizing and reducing flames, page 140; the discrimination on charcoal, pages 142 and 143; smelting with fluxee on charcoal, pages 146 and 147; examination in forceps, page 148; discrimination hy fluxes in the platinum wire loop, pages 148, 149 and 150; the uses of open and close-ended glass tubes, over spirit lamp, at pages 151 and 152; and examinatiou by smelting and water washing, for small quantities of the metals, at pages 152 and 153.

The practically useful and profitable minerals worked by minere, are composed of the following elements:

Antimony, arsenic, hismuth, chlorine, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, sulphur, tellurium, tin and zinc; with the magnesian, aluminous, quartzose and lime rocks.

Before commenciug your tests, write these namee on a slate, or on paper, and then proceed as follows:

Thoroughly fuse some of the finely pulverized ore with carbonate of soda, within the small terminal eye or loop of platinum wire, in the oxidizing flame; and notice the color of the glass.

If the glass is *pale yellow?* *Chromic acid* is present, from some chromate ort.

If the glass is of a *bluish green?* It has heen produced by *manganese.*

If of a *copper red?* From *copper* reduced hy this flux.

If of a *tead colored enamel?* From reduced *lead.*

If not thus colored, erase chromium, and manganese from your list, and test for ths remainder.

Fuse in similar manner with horax.

If the glass is *blue?* The mineral is *cobalt.*

If light *bottle green?* *Iron.*

If *amethyst?* *Manganese.* (But this would not he present if the carhonate of soda failed to show it.)

If of a *reddish brown?* *Nickel.*

If neither color? Expunge cobalt, iron, and nickel from the list.

Place a emall piecs of ths mineral, of abont the size of a grain of wheat, upon unfluxed willow or pins charcoal, and subject it to the oxidizing flame of tbs hlowpipe, until an intense heat is produced, which continue for about one minute, (and when cold it may be applied to the magnetic needle), as a *colldteral test for iron.*

If no *white* or *yellow oxide* is dsposited on the coal, the specimen does not contain *antimony, arsenic, bismuth, lead, tin, tellurium* or *zinc,* and those may he also erased from the list.

If you wish to examine for ths rocks, do so now.

Quartz scratches glass befors and after strong ignitiou.

Lime would now *dissolve,* or slack in water.

Magnesia and *alunina,* when moistened with a drop of the "solution of cohalt," and again strongly heated, will respectively show their charncteristic *flesh* or *blue* colore.

If a *white oxide* deposits on the cbarcoal, at some *distance* from the test sample, it will he from *antimony, arsenic* or *tellurium.*

Antimony has a pleasant *flower-like* odor; *arsenic,* a disagresable *garlic stink;* and the oxide of *tellurium* will hurn off, with a *green flame,* before that from the blowpipe.

If the oxide on the charcoal is *white* and *close* to the test sample, it is produced from *tin.*

If the oxide is *yellow when hot,* and *white when cold,* it is that of *zinc.*

The oxide of *tin,* when moistened with "solution of cohalt," and re-heated before hlowpipe, becomes of a *greenish blue color;* while the *oxide of zinc,* when thus treated, changes to a *bright green.*

If the oxide on ths charcoal is *yellow,* it is either from *lead* or *bismuth.*

Smelt on charcoal with carbonate of soda and these miuerals will be thus reduced to metals. Bismuth is very brittle, and lead very ductile, nnder the hammer.

You have now thoroughly tested for all but chlorine, coppsr, mercury, and sulphur.

Copper was alluded to as coloring ths first bead of carhonate of soda, but it may he uow further tested and more effectually reduced on charcoal, when fluxed with, say, equal parts of carbonate of soda and sugar, to irregular nuggete of *red metal.*

It may bs also detected in very small quantities when it bas been first roasted in flame, theu moistened with hydro-chloric acid, and *re-flamed;* as it first gives the blue flame, from the chlorine of the acid, then finishes with the *beautiful green flame* of copper.

Chlorine. Fuse in the platinum wire a head of microcosmic salt, with as much oxide of copper (or any copper ore thus oxidized) as it will absorh, then add the liquid or solid, that is to be tested, and place it into or hefore the flame; if chlo·ine is present it will soon show its *characteristic blue.*

Sulphur. Lay the first head formed with *carbonate of soda,* or any other of the slags from the smeltings with that flux, on a moistened silver coin, and if the ore is a sulphuret, it will, by forming the soluble sulpbate of soda, stain the hright silver, from *brown* to *black,* according to the quantity of sulphur present, or time given for the discoloration.

Mercury. Place a small piece of the raw ore on a gold or copper coin, and impinge the flame from the blowpipe thereon, for a few seconds, so that the heated current, beyond the test sample, may pass close down upon the cold coin, when—if it he an ore of mercury—its fume will condense and *amalgamate the surface of the metal,* which can he more distinctly observed, after the coin has been rubhed with a wet finge·.

The coin may be again cleaned hy warmth.

Thus the qualitative analysis of the profitahle base minerals may he readily and thoroughly completed, by men knowing nothing of minerals at sight, and the particular metal or metals found, may be then assayed for correct quantity by either of the convenient modes.

The short abstract statement of operations for testing by the above mode, as given beneath, may be easily remembered.

1. Test with carbonate of soda in platinum loop, for *colored beads* of chromium, manganese, copper and lead.

2. Test in similar manner, with borax, for *colored beads* from iron and nickel, and also look for *collateral amethyst color,* of manganese.

3. Test ou charcoal, for iron, *by the magnetic needle;* for the oxides of antimony, arsenic, hismutb, lead, tin, tellurium and ziuc, by their *colors,* etc., etc.; and for the rocks, of quartz hy *hardness,* lime hy *its solubility,* and of magnesia and alumina hy the flesh and blue *colors produced* hy "nitrate of cohalt" solution.

4. Test for copper, hy *actual reduction* and *color of its flame* when dissolved in hydro-chloric acid; for chlorine, by a copper saturated bead of microcosmic salt, *by its blue flame;* for sulphur, by fusion with carhonate ot soda, and dissolving the mass on a silver coiu, *by its brown color;* and for mercury, hy bot blast to the sample when placed on a gold or copper coin, *by its amalgamation.*"

Quartz Mining in Calaveras County.

A review of the quartz mining iuterests of Calaveras, says the Calaveras *Chronicle,* evidences that that important hranch of industry is in a flourishing condition, aud that tbe progress made during the past ssason is both satisfactory and gratifying. Reports from the various mining districts are in the main favorable, and ths prospects for the future hright and encouraging. With ths single exceptiou of Amador, Calaveras stands first in the list of mining counties, and if we continus the present rapid rats of development our "little" neighbor will have to be vigorously energetic if we do not wrest her laurels from her. That we have as good l·dges as are found in Amador there is no question, while we possess the further advantage of having a much wider extent of mining territory. What has given Amador the precedence of Calaveras in mineral development is the fact that in the former county work bas been concentrated upon a single ledge, while here operations have not been confined to any particular locality. We have always been of the opiuion, and we see no reason for changing it now, that the mode of operations pnrsued in Amador for the development of her quartz mining iutereste is the proper one, and have repeatedly urged its adoption here. A few thoroughly developed paying mines are a better recommendatiou for a mining district than a thousand half-prospected, unrsmunerativs lsdges. Work and money enough have heen expended upon quartz ledges in this county, if they had been concentrated and systematically applied, to havs given us mines in every respect equal to the best Amador bonsts. While it is undoubtedly true that the great number and variety of gold-hearing ledges that traverse this county in every direction will ultimately make Calaveras the foremost quartz mining section of the State, that advautage does not so immediately induce the co-operation of capital as the sbipment of large amounts of bullion.

In noting the progress of mineral development throughout the county, attention is first naturally directed to the well-kuown Gwin mine, in Lower Rich Gulch. Notwithstanding ths preseut scarcity of water for milling purposes, the work of development is heing vigorously pushed, and the prospects of the mine were never more encouraging. Tbe ledge—a wide, well defined, rich vein—has been etruck in the 700-foot levele, and the work of "stopping" out the rock commenced. Water enough to run twenty-four etamps has recently been obtained, and a battery of that size will be kept constantly in motion. The main shaft is to he sunk a hundred feet deeper—eight hundred in all—as soon as possible, a contract for the work having already heen let. The pay chimney, which has been mined throngh the various levels from the surface dowu, increases in length and improves in quality of ore as greater depth is reached. The 600-foot level is already extended about three hundred feet south without reaching the terminus of the pay chute. How far the chimney extends to the north has not yet been ascertained. In the hottom of the shaft the ledge shows better than at any point above, and there is svery reason for believing that ths vein will continue good through the present and many future sinkings. That ths Gwin mine is a permanent and will prove a profitable one there is no question, and wsrs it ours to-day we would not exchange it for any other on the coast.

From ths upper country we have flattering intelligence. At West Point work is being pushed ahead upon all the notahle minee. The Zacetera, Ohio, Lone Star, Bartolo and others of lesser note are developing splendidly, the Zacetera, especially, showing eome of tbe finest ore ever placed ou a dnmp. West Point is one of the business camps in the county. In the vicinity of Railroad Flat several very promising ledges are being worked, the Wolverine and Sanderson being among ths most prominent. Ths shaft in the Wolverine is down 300 feet, and is to he sunk 200 deeper ae speedily as practicable. The Sanderson is showing a wide ledge of excellent rock at tbe depth of 180 feet. We shall he able to chronicle a large yield from that mine shortly. At Mosquito Gulch the mining interest is looking extremely favorable. The Good Hope, San Bruno, Dolly Varden and other mines are making handsome showings. A large mill is being put up and the camp wears a flourishing aspect. In the Sheep Ranch district the miners are all husy. The celehrated mine of Wallace & Ferguson continuee to pour forth its golden stream and many other ledgee are heing profitably worked.

At Angels the "hig mine" is being persistently worked, with what results we are not acquainted. A depth of 600 feet bas heen reached, and the ledge thoroughly prospected hetween that point and the surface. We are sorry to learn that labor has been suspended upon the Stickle mine in that place, hut only temporarily, we hope. Taking everything into consideration the quartz mining outlook is encouraging. Fair progress in the development of tbe mineral resources of the county is being made, and the prospects for the future are as promisiug as the most sangnius can deeire.

Who shall own the Irrrigating Canals?

The questions—Is summer or winter irrigation dssirable? Shall we Irrigate? are both settled in the affirmativs. We must turn the waters of our great mountain reservoirs, out of their present channels, upon the parched plsins, for thess waters will cause one hundred hlades of grass to grow, where only a single wesd grows now. The importancs of the subject, brought home to the minds of thousands by the recurrence of drouth, to a greater or less exteut, over their hroad acrss, during the last four years, has determined the matter to hs a necessity of the first importance.

All at oncs, or within three or four years, it is discovered that there is as mnch real money value in the waters, which annually run to wasts in the channels of our mountain streams, as in the lands which horder them; that thess watcrs can be made to quadruple ths valus of these lands has heen provsn in numerous instances. Systems of irrigation thsn, that shall use ths last drop of these waste waters, will bs sooner or latsr adopted.

It is of the firet importaucs then to the fai·mers of the districts to be watered, that they securs to themselves the control of the entire systsm of canals and their waters. No company of capitalists, should hs allowed to get possession and hold the water interests, of this or any other country, and our farmsrs should oppose, in aud out of the Legislature and Congress, and in every Farmers' Club and Grange, the granting of any exclusive watsr privilege for purposes of irrigation.

A railroad company takes offense at the action or inactiou of a city or village, through which their road passes, and as if to punish its citizens for their temerity, thsy withhold every possible convenience in thsir power, otherwise easily derivable from ths operations of the road. An irrigating company, holding the power to diepense its waters where and to whom it may please, may, after a certain district of country shall have bsen built up from a desert to one of fertility and beauty by their canal, suddenly for some mers imaginary cause, cease to dispense its waters except at a "ring" price, and the very commuuity for whose benefit the canal was made, suddenly finds itself at the mercy of a soulless corporation, to be wholly deprived of the fertilizing waters, or suffer the most onerous exactions.

Our mountain ressrvoirs and their out-flowing waters sbould belong to the State, aud the State only should control its irrigating cauals, as ths State of New York does its Erie canal, for transportation purposes; and no other party or power than that of the people, and they entirely apart from speculative capitalists, should ever be permitted a controling power, either in their construction or management; and wo here caution the farmers of the State against any and every attempt of the money power to gohble up this, now, infantile interest, but one which is destined to assume gigantie proportions and importance at no very distant day.

There are indications that application will he made to the next Congress asking exclusive rights and privileges for the prosecntion of vast schemes of irrigation in thie State, with the right to all the water and water-way, and as much of the land as their utmost cupidity will warrant. These schemee should he met hy resolute and determined opposition. The peopls should stand up and inch by inch dispute the progress of the power that would crush or enslave ns or make us subservient to their avaricious grasp. Better let ns have our irrigating canals hy slow degrees in the right hands, than that a stupendous monopoly ehould construct them all in a year, and then hold them ae a terror over us.

In all the great irrigated districts of Europs, Asia and Africa, the canals and means of irrigation are everywhere the property of, and regulated by, the State, and uo such franchise as will he asked of our Congress ought ever to be in the hands of an individual moneyed monopoly in California.

As there is no political phase presented in tbis thing, we can see no good reason why the hosts that now constitute the Patrons of Husbandry in this State, may not be marshalled in solid phalaux in defence of the people and their water rights; and so far as Congress is concerned, Eastern Patrons will bs with us in the fight.

Jute Manufacture.

The Farmere' Jute Manufacturing Company was incorporated on the 10th of September, 1873. The objects of the corporation are tn manufacture all descriptions of juts goods, more especially burlaps, grain bags aud wool sacks.

The demand for grain sacks and hurlaps has increased to such an enormous sxtent within this last few years that as an articls of commercial importance the manufacture of jute has hecome ons of the great commercial staples of hoth thie country and Europe—ranking second ouly to the grain itself, and heading the list in all our commercial records. Tbis fact is eo thoroughly estahlished, so patent to everyhody, and so well understood hy those familiar with the suhject, and has heen discussed and advocated eo frequently and at euch great length by the leading newspapers of the country within the last few months, that it would almost ssem superfluous to urge the consideration of such an sntsrpriss for encouragemeut at ths hands of the public; yet the puhlic, and particularly the farmers, are invited to lend their co-operation to ths enterprise, as ons promising ths fnllest success, not only in supplying an indispensable requisite, but promising to be highly remunerative to stockholdere as an investment. Tbe company have issued a prospectus, setting forth the advantages claimed for the enterprise, and it is an intsresting exhihit, which we would recommend to ths perusal of evsry farmer in California.

THE ENGLISH LANGUAGE.—The words of the English language are a compound of several languages. The langnage may be looked upon as a complication, both in words and expressions, of various dialects. Their origin is from the Saxon language. Our law term sare derived from the Norman our military terms from the French, our scientific terms from the Greek, and our stock of nouns from the Latin, throngh the medium of the French. Nearly all English verbs are taken from the German, and nearly every noun or adjective is taken from other dialects. The English language is composed of 15,733 words—of which 6,732 are from the Latin, 3,312 from the French, 1,665 from the Saxon, 1,669 from the Greek, 691 from the Dutch, 211 from Italian, 106 from the German, (not including verbs,) 90 from the Welsh, 75 from Danish, 56 from the Spanish, 50 from the Icelandic, 31 from the Swedish, 31 from tho Gothic, 16 from the Hehrew, 15 from the Teutonic, and the remainder from the Arabic, Syriac, Turkish, Portuguese, Irish, Scotch and other languages.

GROWTH OF MANUFACTURES.—Advance sheets of the second volume of the census show an extraordinary growth of manufactures in the United States since 1860, the product of the same being $4,232,325,000 in 1870 against $,885,801,000 in 1860, not including those of mining, quarrying and fishing, which are included in totals of 1850 and 1860. The hands employed in 1850 were 957,059; in 1860, 1,311,246; and in 1870, 2,053,996; capital invested in 1850, $533,245,351; in 1860, $1,009,885,715; in 1870 $2,118,288,750; amount of wages in 1850, $236,755,464; in 1860, $378,878,966; in 1870, $775,584,343; value of materials in 1850, $555,123,822; in 1860, $1,031,695,092; in 1870, $4,88,227,242. Massachussttts has increased her mannfactures from $157,000,000 in 1850 to $553,000,000 in 1870.

Useful Information.

How to Use a Spade.—The man who can handle a spade properly does not find it very hard or laborious work. He first let the spade fall of its own weight, says *Forney's Press*, down to the spot where the spadeful is to be taken up, taking care that the breadth on the surface ground is not more than four inches; then he draws back the spade a little, which takes off much of the friction of the descending blade. One good thrust of the spade with the foot then sends the blade down its full depth. A backward pressure makes a lever of the handle and heel of the spade, and a dexterous turn of the wrist sends the spadeful upside down just where it is wanted. There is no raking or "sputtering" needed to make the ground level. A slight tap with the corner of the spade makes the work as regular and plane as if laid off with an instrument.

Waterproof Glue.—Red chromate of potash has the attribute of rendering certain organic matters insoluble, such as gum, glycerine, and gelatine, especially with the aid of light. If a sheet of paper, coated with gum mixed with the red chromate is exposed to the light, the coating becomes perfectly insoluble, even in boiling water. This property is applied in photography in the so-called carbon process. Strong glue becomes insoluble more rapidly than gum, the action going on slowly even in the dark. A concentrated solution of the red chromate is prepared and kept in a dark place, when required, a little of it is added to some dissolved glue. Articles glued with this preparation may, after the lapse of some time, be washed without inconvenience either in cold or boiling water. Paper prepared with this glue becomes a kind of parchment, and serves for the covers of the pea-sausages (Erbswurst) used in the Germany army.

Rubber Cement.—As rubber plates and rings are now-a-days used almost exclusively for making connections between steam and other pipes and apparatus, much annoyance is often experienced by the impossibility or imperfection of an air-tight connection. This is obviated entirely by employing a cement which fastens alike well to the rubber and to the metal or wood. Such cement is prepared by a solution of shellac in ammonia. This is best made by soaking pulverized gum shellac in ten times its weight of strong ammonia, when a slimy mass is obtained, which in three to four weeks will become liquid without the use of hot water. This softens the rubber and becomes, after volatilization of the ammonia, hard and impregnable to gases and fluids.—*Jour. of Applied Chemistry.*

Glass from Granite.—The Baltic *Journal* reports that there exists near several cities of Finland a kind of granite, called there Copakivi, of which the composition is this: Silica, 74 per cent.; feldspar, 12; oxide of iron, 3; lime, 1; alkaliss, with traces of magnesia, 9. This being evidently a good compound to make glass, the first experiment was consequently made by melting 500 parts granite and 200 limestone, and a white glass was obtained. The second experiment was made with 500 granite, 150 lime, and 75 of soda. This glass was more fusible, and at the same time harder. Both kinds were blown without difficulty, at a bright red heat, while a dark glass was made by the addition of 70 parts of sulphate of lime or potash, and 7 parts of carbon.

A Superior Glue.—Dissolve 3 parts of india rubber in 34 parts of naphtha. Heat and agitation will be required to readily effect the solution. When the rubber is completely dissolved, add 64 parts of finely powdered shellac, which must be heated in the mixture until all is dissolved. This mixture may be obtained in sheets like glue, by pouring it, when hot, upon plates of metal, where it will harden. When required for use, it may be simply heated in a pot till soft. Two pieces of wood or leather joined together with this glue can scarcely be sundered without a fraction or tearing of the parts.

Carriage Varnishing.—A good surface may be produced on unpainted wood by the following treatment: Glass-paper the wood thoroughly as for French polishing, size it, and lay on a coat of varnish, very thin, with a piece of sponge or wadding covered with a piece of linen rag. When dry, rub down with pumice dust, and apply a second coat of varnish. Three or four coats should produce a surface almost equal to French polish, if the varnish is good and the pumice dust be well applied between each coat. The use of a sponge or wadding instead of a brush, aids in preventing the streaky appearance usually caused by a brush in the hands of an unskilled person.—*Artizan.*

Manure for Horticultural Use.—Nitrate of ammonia, 400 parts; biphosphate of ammonia, 200; nitrate of potassa, 250; chloride of ammonium, 50; sulphate of lime, 60; sulphate of iron, 40. These ingredients are pulverized, well mixed, and kept in well-closed dry bottles. Sixty-five grains of this mixture are dissolved in one quart of water, and to each plant (in pots or in open ground) is given weekly a dose of from 400 to 1,200 grains; it is best to pour the liquid in the saucers in which the pots are placed. This is highly recommended by Jeannel, the French horticulturist.

Chinese Waterproof Varnish from Blood.—Dr. Scherzer, an eminent Australian naturalist, during a recent visit to China, learned the mode preparing a waterproof varnish very extensively used in that country for coating boxes and other packages which it is desirous to protect against moisture. For this purpose four parts of blood fresh drawn are mixed in four parts of powdered slaked lime and a small quantity of alom. One two, or three coats of this mass, which is slightly viscid, will make a solid coating.

To Restore Color to Fabrics.—When color on a fabric has been accidentally or otherwise destroyed by acid, ammonia is applied to neutralize the same, after which an application of chloroform will, in almost all cases, restore the original color. The application of ammonia is common, but that of chloroform is little known. Chloroform will also remove paint from a garment or elsewhere, when benzole or bisulphide of carbon fail.—*Artisan.*

To Color Alpaca Black.—Take logwood chips, one pound for one dress. Have the goods clean. Put them in and let stand thirty minutes, then rinse and wash in soap-suds. This will do for anything that has once been black.

To Prevent Mold in Books, Ink, Paste and Leather.—One drop of lavender will keep a pint of ink from molding, and, applied to books or leather, will prevent this pest entirely.

To Take Out Fruit Spots. — Moisten the stain and hold the stained part at a safe distance over a lighted brimstone match. The sulphurus acid gas will bleach it out.

To Take Out Mildew.—Rub soft soap on the mildewed part, scrape chalk on it, and lay in the sun. If one application does not remove it, try another.

Good Health.

Sanitary Value of Light.

Professor W. A. Hammond, in *The Sanitarian*, argues strongly in favor of a freer admission of light to dwellings and schoolrooms. After mentioning numerous illustrations of the effect of this agent upon normal and abnormal conditions of the body, he says:

"As has already been intimated, the management of the light in the sick-chamber is rarely a subject of intelligent and scientific action. In anæmia, chlorosis, phthisis, and in general all diseases characterized by deficiency of vital power, light should not be debarred. In convalescence from almost all diseases it acts, unless too intense or too long continued, as a most healthful stimulant, both to the mental and physical systems. The evil effects of keeping such patients in obscurity are frequently very decidedly shown, and cannot be too carefully guarded against by physicians. The delirium and weakness which are by no means seldom met with in convalescents kept in darkness, disappear like magic when the rays of the sun are allowed to enter the chamber. I think I have noticed that wounds heal with greater rapidity when the solar rays are occasionally allowed to reach them, and when they are as far as possible exposed to diffused daylight, than when they are kept continually covered.

"In this country, it is rarely the case that disease or injury is induced by excessive light. Occasionally, however, we meet with eye affections due to excessive light, either coming directly from the sun, or reflected from water, snow or sand, or resulting from the intense light of a flash of electricity passing near the individual. Bright artificial light may also cause derangement of the visual organs. A child of my acquaintance was rendered permanently amaurotic by looking intently at a bright object while her photograph was being taken.

"The practical application of these imperfect remarks is this, that care should be taken both in health and disease to insure a sufficient amount of light to the inmates of houses, and that it is impossible to rear well-formed, strong, and robust children unless attention is paid to this requirement. Sun-baths or apartments in which the solar rays can fall upon the naked body, are doubtless highly advantageous to health, and rooms for this purpose could probably easily be constructed in or on most of our city houses. At present a chief object of city families seems to be to devise means for keeping the sunlight out of their houses. That this is contrary to nature needs no argument. The world is said to be under fed; it is certainly underlit as we manage it. Let us, then, to use the dying words of Humboldt, have '*Mehr Licht.*'"

Fish as a Diet.—Dr. Merryweather says: "A fish diet is a great humanizer of the tempers of mankind. Its consumption tends wonderfully to render them more kindly to one another, and consequently tames the passionate disposition to crime. As carniverons animals are always the most fierce and violent, so become human beings who have carnivorous stomachs. Could such stomachs have an occasional respite by the consumption of fish, the world would be all the better for it. I speak as a medical man and firmly assert that many maladies would be mitigated, and perhaps annihilated by such a process."

Excessive Use of Water.—In the manufactories of all kinds, water (very often iced) is placed within easy reach of every person, male or female, and the effect of this constant invitation is seen in the drinking of what physicians must regard as unreasonable amounts. The food is thereby diluted, the stomach is oftentimes chilled below the temperature of the blood, and by repeated drafts may be kept in this condition. The process of digestion is in this way interfered with. A certain amount (70 to 100 ounces) of water is required daily for the nutrition of an average adult; but of this total requirement, 20 to 30 ounces are contained in the so-called solid food, leaving about sixty ounces to be supplied in some form of liquid, as tea, coffee and water. If this amount is greatly exceeded, it forces additional and needless work on the organs of excretion.

Typhoid Fever when once established in a family generally takes nearly all the members, hence many believe it to be contagious. It is not contagious, however, but like cholera and other kindred diseases, is infectious. The sweepings from an old sewer, leakage from privy vaults, water from wood-lined springs, stench arising from decaying vegetables are all favorable conditions to the acquiring and spread of this disease. An instance is on record where a whole neighborhood passed through a siege of this disease, engendered by using milk from cows that habitually drank from water standing over decaying timber. The preventive is to keep the premises clean, drink pure water, and when unpleasant smells arise, trace them out, remove the cause and apply disinfectants. The person should be washed thoroughly at least once a week.

French medical journals publish the result of experiments to determine how minute a dose of poison will produce decided medicinal effects. The blood of an ox which had been dead ten days was used in the test. Having inoculated a rabbit with blood poison, the doctor took the blood of the rabbit, and so on to the twenty-fifth generation that had died. The result proved that the one-trillionth part of a drop of decayed blood injected subdermally, sufficed to poison a rabbit. From this proving, dissecting surgeons are cautioned that, though the dissecting knife may be clean to the eye, it may yet hold an invisible atom of death poison, sufficient to infect the circulation if the operator should by accident prick his finger. A French savant says that such results ought to open our eyes to the possible effects of minute doses of homeopathy.

Hygienic Use of Tea.—Dr. Adam Smith, in a paper read before the London Society of Arts, recommends the use of tea in the following cases: after a full meal, when the system is oppressed; for the corpolent and the old; for hot climates, and especially for those who, living there, eat freely, or drink milk or alcohol; in cases of suspended animation; for soldiers who, in time of peace, take too much food in relation to the waste proceeding in the body; for soldiers and others marching in hot climates, for then by promoting evaporation and cooling the body, it prevents in a degree the effects of too much food, as of too great heat.

Occupation.—What a glorious thing for the human heart! Those who work hard seldom yield to fancied sorrow. When grief sits down, folds its hands, and mournfully feeds upon its own fears, weaving the dim shadow, that a little exertion might sweep away, into a funeral pall, the strong spirit is shorn of its strength, and sorrow becomes our master. When trouble flows upon you, dark and heavy, toil not with the waves, and wrestle not with the torrent; rather seek by occupation to divert the dark waters that threaten to overwhelm, with a thousand channels, which the duties of life always present. Before you dream of it, those waters will fertilize the present, and give birth to fresh flowers, that will become holy in the sunshine which penetrates to the path of duty, in spite of every obstacle. Grief after all, is but a selfish feeling; and most selfish is the man who yields himself in the indulgence of any passion which brings no good to his fellow-man.

Scientific Education for Farmers' Children.—Talking of the faults of the present system of education, a correspondent of the *Rural Sun* makes the following sensible remarks:

"One of the prime objects of *scientific* education is to train the pupil first to keep his eyes open and collect facts; second, to systematize his facts, to extract their meaning and discover the principle underlying them. The education of the old schools does not do this. It deals altogether with abstractions; does not develop the faculty of observation, and ignores the existence of everyday facts. In short, the old school fails to meet the wants of the times. The new school does meet the demands of the day, and it behooves the farmers to see that it is substituted for the old. Science must be introduced into the primary schools and carried on up through all grades to the very highest."

Domestic Economy.

Boiled Lettuce.—This is a delicious vegetable, resembling asparagus or sea kale, and yet not quite like either. Lettuce may be simply boiled and eaten as other greens, but they can be boiled and served as *entremets* in a variety of ways. Have ready some neatly-cut pieces of toast, of a pale brown color; lay them on a dish, a hot one; let each piece be of a size to hold the lettuce and one poached egg; pour over the toast a little of the water and some gravy. If the latter be not handy, a little fresh butter should be spread on the toast, previous to pouring the water from the lettuce; place on each piece of toast enough of the boiled lettuce to form a flat layer; neatly trim the edges of the vegetable, and place a poached egg on the top. Or prepare some toast as above, and spread over each piece a thin layer of anchovy or bloater paste, on which lay the lettuce; then season to taste. To prepare the lettuce for boiling, they should be well cleansed, and the top of the leaves, if they have the slightest appearance of fading, should be cut off; leave as much of the stalk as possible, cutting off the strong outer skin. When boiled, the stalk is the most delicious part. The large Cos lettuce makes the handsomest dish, but we prefer the flavor of the Drumhead.—*The Garden.*

Caramel Ice-Cream.—Put on to boil three quarts of new milk, beat up the yolks of fifteen eggs very light, adding three-quarters of a pound of sugar. When the milk boils, pour in gradually into the beaten sugar and eggs, return to the fire, letting it remain for about five minutes, stirring rapidly all the time. Meanwhile, in a small iron skillet, place over the fire a half pound of brown sugar, which must melt and be burnt until of a dark brown color; when properly browned, pour into the skillet, a little at a time, boiling custard from the kettle, not minding the sputtering consequent therefrom. When the skillet is full, mix altogether in a bowl, and set in some cool place until ready to freeze. If not sweet enough, add a little more sugar. If the sugar is too burnt, so as to impart a bitter flavor, add cream until the fault is rectified.

To Clean Preserve Jars.—Sweetmeat jars or bottles may be cleaned without scraping them, by pouring in the jars hot water and a teaspoonful or two of pearlash. The contents which remain sticking to the sides and bottom of the jar will be disengaged by the pearlash and float loose in the water. Wash kettles the same way, or other vessels which you wish to purify or clear from grease. Strong lye poured off clear from good hickory ashes will answer nearly as well for the same purpose and for kegs, buckets and other large cooking utensils, lye from good ashes may always be used.—*Ohio Farmer.*

Apple Souffle.—Always stew the apples nicely, then adding a little grated lemon peel and juice, and omitting butter, line the sides and bottom of a baking-dish with them. Make a boiled custard with one pint of milk and two eggs, flavoring with lemon and sweetening it to taste. Let it cool, and then pour into the center of the dish. Beat the whites of two eggs to a stiff froth (they can be left out of the custard), spread them over the top; sprinkle white sugar over them, and brown in the oven. The stewed apples should be about half an inch thick on the bottom and sides of the pudding-dish.

Salt in Cooking.—A writer says: I apprehend that housekeepers generally do not appreciate the use of salt in cooking vegetables. I use it constantly. It will be found to add greatly to their tenderness and flavor. Indeed, there is no comparison between vegetables cooked in fresh water and that somewhat salted. The salt prevents the evaporation of the flavor of the vegetable, which is soluble and would otherwise pass off. Try it. The amount of salt to any given quantity of water, each one must judge for herself, though as a rule it should not be so large as too perceptibly to affect the vegetable.

Rice Waffles.—Take a teacup and a half of rice that has been well boiled, and warm it in a pint of rich milk, stirring it till smooth and thoroughly mixed. Then remove it from the fire and stir in a pint of cold milk and a teaspoonful of salt. Beat four eggs very light and stir them into the mixture, in turn, with sufficient rice flour to make a thick batter. Bake in a waffle-iron. Send them to the table hot; butter them, and eat them with powdered sugar and cinnamon, prepared in a small bowl for the purpose.

Point, or any kind of fine lace, may be cleaned easily by soaking in a preparation of saponine and warm water. If this is not procurable, ammonia may be used with almost equal effect. Let it soak till fit to rinse in pure warm water; then lay it on the ironing board over clean linen, and iron lightly on the wrong side with a cool iron. Afterward pin the lace on the linen covered board, inserting pin in every open loop to keep the pattern clear.

Cheese Sandwitches.—Take two-thirds of good cheese, grated, and one-third of butter; add a little cream; pound all together in a mortar; then spread it on slices of brown bread; lay another slice over each; press them gently together, and cut them in small, square pieces.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—California Animals, Insects, etc., for Europe; Hammond's Cam and Tappet; The Largest Gold Bar; Salmon Breeding on the McCloud River; Our Patent System, 225. Who Shall own the Irrigating Canals; Jute Manufacture, 230. The Graphic Balloon; The Iron Mines and Coal Fields of Utah; The San Juan Mines; A Californian's Gift to Science, 232. California Academy of Sciences; The California Harrow; Patents and Inventions, 233.

ILLUSTRATIONS.—Hammond's Cam and Tappet, 225. The California Harrow, 233.

CORRESPONDENCE.—Notes of Travel in Utah; Quicksilver Extraction; The Proposed Bear River Tunnel, 226.

MECHANICAL PROGRESS.—Submarine Blasting; Fabrication of the Paper for Greenbacks; Sheathing Iron Ships; A Time Recording Clock; Material for Gas; Suppression of Sewage Gas, 227.

SCIENTIFIC PROGRESS.—The Nebular Hypothesis; Purification of Animal Charcoal; Iron in Snow; Assay of Lead; Gold; Sulphozone, 227.

MINING STOCK MARKET.—Tabls of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 228.

MINING SUMMARY from various counties in California, Nevada and Utah, 229.

USEFUL INFORMATION.—How to Use a Spade; Waterproof Glue; Rubber Cement; Glass from Granite; A Superior Glue; Carriage Varnishing; Manure for Horticultural Uses; Chinese Waterproof Varnish from Blood; To Restore Color to Fabrics; To Color Alpaca Black; To Prevent Mold in Books, Ink, Paste and Leather; To Take Out Fruit Spots; To Take Out Mildew, 231.

GOOD HEALTH.—Sanitary Value of Light; Fish as a Diet; Excessive Use of Water; Typhoid Fever; Hygienic Use of Tea, 231.

DOMESTIC ECONOMY.—Boiled Lettuce; Caramel Ice-Cream; To Clean Preserve Jars; Apple Souffle; Salt in Cooking; Rice Waffles; Cheese Sandwitches, 231.

MISCELLANEOUS.—Troy District; Silver Coinage, 226. Phillips's Scheme for Blowpipe Analysis; Quartz Mining in Calaveras County; The English Language; Growth of Manufactures, 230. Cedar and Trout Creek Mines; Ancient Egyptian Mines; One of the Lost Arts; Hard on the Stomach; Gold and Silver; Poisoning of the Atmosphere by Arsenic in Wall Papers; A Wrong Impression; Postal Cards, 234.

THE GRAPHIC BALLOON.—The much talked of balloon expedition across the Atlantic, came to an untimely end, without, however, any loss of life. It started off on the morning of the 6th inst. in charge of Profeseor Donaldson, with Messre Ford and Lunt as assistants. It reached Cannan, in the north east corner of Connecticut at 2:30 P. M., where it was caught in a violent storm. For a few minutes before that, it had been near the earth and Donaldson and Ford jumped out. Lunt was canght in some trees but succeeded in reaching the ground unhurt. The balloon escaped, and had not been heard from at last accounts. Whether Professor Wiee will succeed in getting a balloon to try the experiment of crossing the Atlantic, and whether he will go if he doee, remains to be seen.

MEXICAN MINES.—A correspondent writes that Euglishmen and Americans commence now to look favorably upon Mexican mines, where the titlee are at least indisputable. An American company has lately bought the Sierra Rica, near Paso del Norte, for $55,000 and the new mine of Rio de las Conchas for $12,000. The same company is aleo going to work the famous copper mine of Santa Rita, now situated on American soil, through the Gadeden purchaee. The ore of thie mine ie known as red oxide with blue carbonate, yielding a bright and flexible metal, easily worked, and the metal was used tbirty years ago by Santa Ana to deluge the country with copper coin.

SUSIOULTURE ie the scientific word now adopted for hog-ranching—from *Sus*, Latin for hog, and *cultura*, cultivation. If we want to sustain the dignity of labor, we must follow the fashion, in giving Latin names to our avocations.

The Iron Mines and Coal Fields of Utah.

In the vast number of communicatione written upon the mines and mineral resources of Utah we occasionally find an allusion and only a simple allusion to the immense beds of coal and iron which have been discovered in various parte of the Territory. A person not acquainted with the country would presume that these mineral deposits were of so little value as to be scarcely worthy of mention, while the fact is, they are not inferior in real worth to the rich mines of silver bearing ores and other precious metals that have lately sprung into so much notoriety. There can be no doubt but these mines are very rich, and will ultimately prove a great success, but a large amount of capital is needed to develop them properly and render their wealth available, and it seems as if the miners in Utah deliberately choose the most expensive manner of developing their properties. It is a matter of great wonderment to those who know these vast beds of coal and iron, why Utah capitalists spend so much money in developing prospects that are uncertain, and which sometimes do not yield as much silver as the owners put into them; while such quantities of valuable material lies useless in the ground at their very feet, which might be utilized to large and sure profit, for various local purposes, as well as for the development of other mines. Does it not seem a misapplication of capital to send to Wyoming Territory for large quantities of hematite ores for fluxing, when a superior is found in many districts in Utah in far greater abundance, and which could be obtained at a far less cost than the imported ores, if the mine were advantageously worked. In Rush Valley the native ores have been used with decided success, but in other districts the flux is imported from Wyoming, because it is cheaper than mining it under present circumstances. This system already sends hundreds of thousands of dollars out of the Territory, which ought to be kept at home, besides all the manufactured iron that is imported, and of course, it will continually increase as furnaces become more numerous, and the march of improvement goes on. The demand for this metal in every stage of its existence must increase every year, and we should think that the people of Utah themselves would be alive to this fact, and govern themselves accordingly.

Years ago, when the existence of silver mines was only suspected, the iron mines were well known to the inhabitants and the few strangers who traveled through those mountain valleys predicted that Utah would yet prove the richest iron-bearing country in the world. It is found in the south in immense deposits, and of a superior quality; and it exists in almost every county throughout the Territory, in more or less quantities. In Iron County, on the slopes of the Iron Mountains, the deposits are particularly rich and abundant, and consist of both magnetic and hematite ores. Solid ore is exposed in veins of from five to thirty-five feet in width, for hundreds of feet in length and many of the mountains are covered with fragments of ore, varying in weight from a few pounds to several tons, in which iron for smelting may be obtained without the cost of mining for many years to come. But the difficulty at present is, that until rail communication is perfected the cost of transportation to localities where it is employed is more than the expense of imported material.

In all mining localities good mineral fuel is indispensable, and, of course, if it is not native, it is necessary to import it, and also for domestic, as well as mining purposes. But what shall we say regarding the economy and enterprise of a people who import an article in large quantities, when an abundance is to be found at home. Utah Territory consumes monthly, more than one hundred tons of Pennsylvania made coke, costing $35 per ton, while it has been said by experts that there is not a country in the world can rival Utah in the extent of its coal beds. It exists in the Wahsatch Mountains, the Iron Mountains and in all valleys of the southern rivers. In San Pete county it is said to be of a superior quality, cokes readily, and altogether is equal to the anthracite coals of Pennsylvania. That found in the northern part of the Territory is of a different quality, still it is very well adapted for all general purposes.

But it was not our intention to enter into a minute description of the different qualities, or the location of either the iron mines or the coal beds, as one wishing to become interested in either can easily ascertain all particulars for himself. We simply wish to state that in this Territory is a field for operation in these minerals unsurpassed anywhere on this continent, the development of which would be of great advantage to the other Western States as well as to Utah. In the year 1872 the United States imported nearly two million tons of manufactured iron, a fair proportion of which was used in the States and Territories on the Pacific Slope. This fact alone would indicate the necessity of encouraging home manufactures, especially as the raw material exists at our doors in such superabundance. It is estimated that these States use nearly 100,000 tons of iron annually, at a cost of about $9,000,000, and as a great deal of this comes from foreign countries, it is obvious what an immense saving it would be if it could be manufactured where good ores and suitable fuel are found close together, and in such inexhaustible quantities.

Of course, considerable capital would be needed to conduct this enterprise, furnaces would have to be erected and railroad transportation perfected. But capital is necessary for almost any business undertaking, and in this we see a field for speculation and enterprise that can scarcely fail to produce brilliant results. Useful and necessary commodities can never fail of obtaining a good market, especially if they can be produced cheaper than foreign articles.

There are in Utah a few enterprising capitalists who appreciate the importance of developing these mines, and who have taken some initiatory steps in the matter. Railroad companies have been organized, and one projected route has already been surveyed, and this is one of the most important considerations. Let railroad transportation at reasonable rates be once established, and then perhaps the people will see the necessity and advantage of inaugurating and continuing a manufacture, which will be so valuable to the country, and also profitable to the railroad companies.

The San Juan Mines.

Reports from Denver, Colorado, state that Thomas K. Cree, Secretary of the Board of Indian Affairs, arrived there on the 27th ult. bringing with him a copy of the Brunot Right Treaty, signed by the Indians, in company with six Indian Chiefs. Mr. Cree spent a week in exploring the Brunot purchases. They visited the San Juan mining region, and report it immensely rich in gold, silver, copper, lead, iron and coal. Five hundred valuable leads have been located, and one mine, the only one fully tested, is yielding, with poor machinery, $1,000 in gold per day. This mine, the Little Giant, sold without legal title to a Chicago company for $500,000, and, since the treaty, is valued at $1,000,000. It is expected with the improved machinery now en route, that it will yield $25,000 gold per week. A mine with better indications, on the same lead, is being negotiated for at $450,000. The ore from this lead yields from $2,000 to $5,000 per ton. Another gold lead, undeveloped, yields $8,000 per ton. The country is equally rich in silver ore. There are numerous veins of copper cropping out on the surface, none of which are taken up. Iron and coal lie in close proximity, the latter of superior quality for smelting purposes.

Fifty town lots were located on the news of the treaty being signed. The country is immensely rich, and, with capital to develop, is good for $100,000,000 of precious metals.

The party report the country the grandest in the world for mountain scenery. The mining district is said to be surrounded by as good a chain of mountains as there is in the country. The country acquired, contains four millions of acres of valuable mineral land. The proceedings were in the shape of an article of agreement and do not come under the head of a treaty. This San Juan country has excited the cupidity of mining men for a long time and probably there will now be a great influx of miners and prospectors, who will quickly prove whether the county is as rich as represented or not. Values of gold or silver mines without shafts or tunnels are extremely chimerical, as any miner of experience knows very well. We have heard before of ore from certain leads yielding from $2,000 to $5,000 per ton, and the reports from Denver even say an *undeveloped* gold lead yields $8,000 per ton, so of course they must mean assays, not yields, which is a totally different thing. The writer, during the White Pine excitement, made assays of ore running from $5,000 to $25,000 per ton, but how much of the ore ever worked like that? Averaged through, if it paid $25 per ton it did well. The man who gave the information published above must have been considerably excited and used his multiplication table too freely when giving the figures.

It is always the case, however, when any new section is discovered or opened up, that the reports are fearfully exaggerated. This has done more to bring the business of mining into bad repute than, perhaps, anything else. But we on this coast know when people talk about $8,000 per ton, or even $1,000 per ton for any ore in paying quantities, that they must be either very green or want to talk some one in. Good paying mines never show any such figures. Exceptional cases are frequent, of course, and very often a rich chimney is struck, where a few hundred pounds, or a few tons of very rich ore come out. If a man has got a gold mine of any size, which yields $25 or $30 per ton right along, he will do very well without running after any $8,000 rock.

A Californian's Gift to Science.

We have several times mentioned the handsome gift of a valuable piece of land by James Lick, of this city, to the California Academy of Sciences. The conditions under which this gift was to be accepted were, however, so onerous that the Academy had a sort of "White Elephant" on its hands. The building specified in the deed would have cost $250,000, and the sum necessary to maintain it according to the conditions would have been as much more. This large sum the Academy thought it impossible to raise. The trustees, therefore, drew up a paper and gave it to Mr. Lick, stating the difficulties in their way, and asking him for some satisfactory solution to the problem. One objectionable feature was that in case any one of the conditions, under which the deed was given, was not fulfilled, the property reverted to the donor. With this in the way, the trustees were unable to succeed in getting any money, as those to whom they applied said that in case the Academy failed in any way to comply with the minute conditions, the building and all improvements would revert to James Lick or his heirs, and they did want to enrich him or them.

These difficulties have prevented any advancement in the matter, but the trustees have been busy striving to surmount them, and at the last meeting of the Academy, the President, Professor George Davidson, made a highly gratifying report of the result of negotiations with James Lick, for the modification of the conditions originally attached to his donation of a building site to the Academy. He stated that in connection with Mr. Staples, of the Society of Pioneers, several interviews were had with Mr. Lick, relative to the deeds of land and the inability of the Society to carry out the plans as proposed. Legal talent was employed to draw up new deeds, and to see that there were no flaws in the instrument. At first Mr. Lick objected to some of the liberal conditions made in the modified deed, but on Saturday last he consented to give new deeds for a lot 80 feet on Market street, by 275 deep. The conditions of the new deed are that the property shall not be encumbered or allowed to be sold for taxes; that it shall not be alienated during the life time of the existing members; that no part of the edifice shall ever be leased for religious or political purposes, and may only be rented for literary and scientific purposes; that the Academy shall erect the necessary edifice within a reasonable time (ten years); that the edifice shall be a substantial brick building, three stories high, with marble or free-stone front, of classic design; that it shall always be kept for the purposes of the incorporation, and erected as soon as the funds are obtained, written notice to be given to Mr. Lick, or his executors, thirty days previous to commencing the work. If the society fails to carry out the work, the property shall revert to the State of California, in the hope that the law-making power will devote the property to objects of science. The Academy has several years in which to raise the money, and if it fails the property goes to the State, and does not revert to Mr. Lick as was the case in the original deed.

The first gift was a lot 80x275 feet. Then Mr. Lick added 40 feet more, making a lot 120x275 feet. The last deed calls for a lot 80x275; but this is abundantly large for all the needs of the society. This deed is as liberal a one as could be made without giving an absolute title. Under the new deed the halls or rooms may be rented for literary or scientific purposes, and the Academy is not restricted as to the style of building. Before, a granite front was specified, which would have been very expensive, as it had to be adorned with appropriate scientific emblems. Mr. Lick's generosity in this matter is commendable, and it is to be hoped that his example will be followed by some others of the many wealthy gentlemen of California. Other cities put us to shame in this respect. Judge Hastings called the attention of the Academy to what had been done in Chicago. This Academy building, which cost $1,000,000, was destroyed by the great fire, and it has been rebuilt already. If such a thing as that could be done there, we in California ought surely to do something of the kind. The collection belonging to the California Academy is a credit to the State and city; but as there is no place to exhibit it, and it is almost all packed away in boxes, no one can see it. For the credit of the State it is to be hoped that Mr. Lick's generous donation will be followed by others, in order that the California Academy may stand on an equal footing with similar societies in the East.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, President Davidson in the chair. William Kohl was elected a life member, and Dr. J. D. B. Stillman and Geo. S. Ladd, resident members. There were upwards of 40 members present and a number of visitors, including several ladies. The donations to the museum were plentiful. Among them was the carapace of a

Tortoise Shell Turtle,

From the Gulf of California, presented by Capt. Wm. Metzgar, of the steamer "Newbern." In connection with this shell Mr. Stearns said: "The family *chelonioidæ* includes the turtle whose general form is somewhat heart-shaped and flattened on one side, and furnished in front with a pair of large, flat wing-like scaly flippers and behind with a pair of scaly rudders. The genus *chelonia* contains the green turtles so highly prized for food. The genus *eretmochelys* (*caretta*), to which this carapace belongs, includes the so-called tortoise shell or hawk-bill turtles, the large scales or plates of this group furnishing the highly prized tortoise shell, used in the arts. The best tortoise shell comes from the Indo-Pacific region, and Singapore is the principal market for it. The plates are prepared for manufacture by being washed, boiled and steamed, and while warm and damp are flattened out by pressure. It is stated that on some of the coasts, where these turtles are caught, the natives remove the plates without killing the animal and return it to the sea, so as to obtain a second set of plates. The flesh is not so highly esteemed for food as is that of the green turtle, previously mentioned. The family *chelonioidæ* also includes the genus *thallasochelys* which embraces the largest of all the turtles, the *sphargis*, which belong to another family, known as *sphargidæ*. In this family the species have a more elevated shell than the *chelonioidæ*, and instead of a hard shell, the body is covered with a thick coriaceous skin. *Sphargis coriacea*, Gray, is the largest of all turtles, sometimes weighing from a thousand to two thousand pounds, and attaining a length of eight feet. This latter species is found in the Atlantic Ocean and Mediterranean Sea."

Dr. Blake exhibited a

Fossil Tooth

Of a species of shark. It was found near Martinez, probably in the cretaceous rocks. When entire, the tooth would measure about five inches in length on the edges and three and a half inches broad. It is of a triangular form. The anterior surface is flat; the posterior, convex. It undoubtedly is the tooth of a species of *carchorodon*, a genus containing the largest of the sharks, the animal to which the tooth belonged, being, probably, upwards of 60 feet long. Dr. Blake was unable to determine the species, but inclined to the opinion that it is the tooth of *carchorodon subauricularis*, as the ridge at the base of the enamel is decidedly more curved than in the *C. megalodon*. This curving of the basal ridge would indicate that the sides of the tooth were prolonged downwards, a characteristic of the *carchorodon subauricularis*.

Other Donations to the Museum.

From J. S. Lawson, of the U. S. Coast Survey, a large collection of shells was received and two very large star fish.

Professor Davidson presented a collection of shells from San Pedro bay.

Henry Edwards donated a piece of petrified Mezquite, from Arizona, and a double headed snake from Tuolumne Co., California.

E. W. Harral sent a tarantula's nest, containing a live tarantula, from Chinese Camp.

The skull of a Flathead Indian, from Kilisut Harbor, was presented.

Collections of Pacific Coast fishes were donated by different members.

Professor Davidson said that he had obtained the fossil bone found near Lake Merced, and would bring it to the rooms of the Academy. Capt. Scammon has recognized it as the back portion of the head of a hump-backed whale. It weighs 850 pounds. The first discoverer of these bones supposed them to be those of a mastodon.

Communications.

A paper of Henry Edwards was read, entitled "Pacific Coast Lepidoptera, No. 2,—on the Transformation of the Diurnal Lepidoptera of California and the adjacent districts." In the hope of calling the attention of observers to the earlier stages of our butterflies, Mr. Edwards has compiled from his own researches and from the best published material at his disposal, descriptions of all the larvæ and chrysalids with which entomologists are at present acquainted. He said it was to be regretted that the list was so small, and that so little attention has hitherto been given to this interesting branch of study. Out of two hundred species of diurnal *lepidoptera* inhabiting this Coast, only about twenty are known in the larval condition, and these are, for the most part, imperfectly described. The importance of these earlier conditions of closely allied species cannot be over-estimated, and it will be seen from the poverty of our present knowledge how large a field of interesting observation is open to the entomological student.

A paper entitled "Note on *Alexia Setifer* and its allies," by Dr. J. G. Cooper, was read.

A communication was read from W. A. Goodyear on the hight of Mount Whitney, and the method by which the observations were taken from which the altitude was computed.

Miscellaneous.

Professor Davidson exhibited his improved leveling rod, and described the method of operating it. We gave a detailed description of this rod in our issue of Sept. 6th.

The President called attention to a new apparatus for bringing up portions of the bottom when sounding, invented by Commodore Belknap, of the U. S. Steamer "Tuscarora." By the method employed a large quantity of the bottom mud can be brought up, and a compartment is arranged with appropriate valves, so that water from great depths can also be raised. This has heretofore been very difficult, if not impossible. This invention is by far the best of all the forms of deep sea dredging apparatus on board the Tuscarora. The best practical proof of its value is that it brings up portions of the bottom every time.

A peculiar hen's egg was exhibited to the members, upon which was a sort of pattern like lace. Some of the members thought it was artificial, while others thought that the curious appearance might have been produced by a diseased condition of the membranes of the fowl.

Judge Hastings wanted to hear from Dr. Gibbons, on the subject of meteorology, particularly in reference to the coming winter. Doctor Gibbons did not think there was any means of foretelling.

A communication was read from a gentleman in England, who wished to become a corresponding member. It was laid on the table.

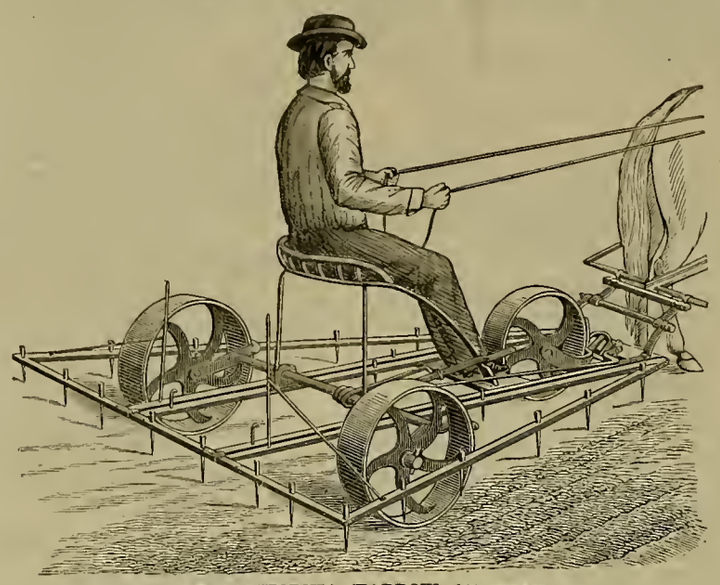
A communication was received from his honor the Mayor, enclosing a letter from the Acclimatization Society of France, and a new deed from James Lick was received, both of which are elsewhere referred to in this issue.

It is said that many kinds of our cotton goods are successfully competing with English goods in different parts of the world; and in the East Indies and South America there is said to be shown a decided preference for our make of goods.

The California Harrow.

We present to our readers this week an illustration of an improved harrow, manufactured by the Kimball Manufacturing Company of this city. To a farmer or anyone who performs the actual farm labor, it has many apparent advantages for easy and quick dispatch of work over other inventions of its character. It is plain and simple in management and strong and durable in construction; possessing many points which to the farmer who works the rough or smooth lands of California are easily appreciated.

The method of operation can be seen by reference to the cuts. The frame of the harrow rests on three wheels. The front is a castor wheel and will admit of as short a turn as will at any time be found necessary. By means of a lever the driver regulates the depth of the teeth in the soil with as much ease as he would manage a mowing machine in a meadow. In moving from place to place, he can in the same way, raise the frame of the harrow from the ground, drive off any distance, dispensing with help and the labor and time of loading and unloading in a wagon every time it is desired to change locations. By means of the lever the wings can be turned up with little delay and the teeth cleaned of all clogs without the driver moving from his position.



THE CALIFORNIA HARROW AT WORK.

THE CALIFORNIA HARROW ON THE ROAD.

The easy seat for the driver is a long needed and wished for improvement over the old fashioned way of following on behind the drag all day, stumbling about and doing a hard day's work in keeping up with the team. The driver in his seat can handle his four or six-horse team with all the skill and management of an "old stager," doing away with all aid or help. The implement is put together in two sections; the harrow can be enlarged to six, nine and twelve feet wide. The construction of this harrow is very simple and there is no intricate mechanism to get out of order. While examining one of these implements at the Kimball factory on Fourth Street recently, we gained the following information as to prices. Two horse harrow No. 1. six feet—$55: Four horse harrow, No. 2. nine feet—$60: Six horse harrow, No. 3. twelve feet—$65. Parties desiring further information in relation to this subject can address the Kimball Car and Carriage Manufacturing Co. in this city. The patentee, B. W. Taylor of Roseville, Placer County, Cal., is also authorized to take orders and give any required information.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., October 4th, 1873.

For Week Ending September 23d, 1873.*

Box Former.—Geo. W. Swan, S. F., Cal.

Saddle for Wire Ways.—Thomas M. Martin, S. F., Cal.

Windmill.—Jonathan Hoag, San Raymon Valley, Cal.

Needle Threader for Sewing Machines.—Thomas Schofield, Grass Valley, Cal.

Flexible Vertically Extensible Attachment for Boats.—John R. Adams, Oakland, Cal.

Machine for Cleaning Streets of Snow.—William E. Musgrove, Fair Play, Colorado Territory.

Trade Mark.—Newton Bros. & Co., S. F., Cal.

———*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

New Beds.—The *Record* notices a new invention, exhibited at the State Fair, for which a patent has been applied for through this office, as follows:

A. T. Sherwood & Co., of Sacramento, exhibit Sherwood's elastic bed. This bed consists of three rows of spiral springs, rising from a light wooden frame. The springs support broad thin wooden elastic strips, which, at either end, are held by a cross-bar in which the slats have about an inch and a half of play. From the cross-bars, on either side, run two longitudinal wooden bars to the opposite ends of the wooden foundation frame, where they are secured by screws. These form additional springs. The pressure of the bed on the strips, as may be easily conceived, is proportioned and equalized, and the springs are held constantly in an upright position. When the bed gives, the weight is graduated to the whole surface, and the body descends in a line. The strips are close to each other, and form a smooth and indestructive surface for the mattresses. The whole weight does not exceed 35 pounds. There is no net work of springs, no inclosed frame, no ropes or cords, etc., to accumulate dust and dirt. The beds are warranted for five years. Their elasticity and simplicity are worth attention.

Sherwood & Co. exhibit a newly invented camp bed or cot, being a canvas bottom swung between bars, which fold with four joints. The legs are two X's, which joint by peculiar sockets into the bars. A cross bar binds the legs, and is fastened by self screws by a single turn of the hand. The upper joints of the bars for a headrest are raised and held by straps, and thus a complete bed is formed, put up and made ready in a moment. In thirty seconds it is down, folded, rolled into a package not larger than an umbrella, and ready for transportation, at a weight of about 12 pounds. Sherwood & Co. exhibit one more of their inventions demanding notice. It is one of their elastic beds pivoted in a bedstead, upon the head-board of which is a pulley with a spring paul working in a rachet. From this one cord descends to the pivoted frame, and another to the invalid's hand. The sick person pulls a tasseled cord which lifts the paul from the rachet, and a slight effort upon the pulley, made by the weakest, raises or lowers the bede to any desired angle. By a simple motion the end of the bed is secured, and as it raises it breaks into a sort of chair, bringing the body to a sitting posture. The invention is a Sacramento one and worthy examination by every one.

The Eureka Mine Case.—The Secretary of the Interior has not yet decided the case of the Jenny Lind and other mining companies vs the Eureka Mining Company, of Nevada. The law officer of the Department, Assistant Attorney-General Smith, has submitted his opinion recommending Secretary Delano to reverse the decision of the General Land Office, which was in favor of the Eureka Company. The Secretary, however, states that he will carefully examine the question for himself.

Cedar and Trout Creek Mines.

The following description of tbe mines on Cedar Creek and Trout Creek, Montana, we take from the Deer Lodge *Independent:*

Messrs. J. A. Robinson & Co., carry the United States mail and the express from Missoula to Cedar, tri-weekly, leaving Missoula Mondays, Wednesdays and Fridays. They run a stage as far as Mrs. McCahe's Station, 31 miles from which point, saddle animals are used to Forest and back. Fare from Missoula through is $15. At the mouth of Cedar we found two ferries, tbe old one kept by Mr. Jos. Booth and a new one by Mr. Wm. Berry. The competition has resulted in a reduction of one-half on fares, and the traveling public are pleased.

Eight miles above the mouth of Cedar we came to the dump of Miller, Powers & Co's bed-rock flume, and following it up one and a half miles came to the head of it, where some 8 or 10 men were engaged in ground-sluicing, and shoveling in some three feet of gravel, which they think is paying well. Their last clean-up amounted to $1,400 and they expect to make another next week much larger than tbe first. They hope to reach the rock with the flume before the season closes, when they will he able to work much more advantageously.

The next company above, John Keneeley & Co., are running a hydraulic on the bar, right hand side of the creek, and had just cleaned up $860 from a cut 45x24 feet. James Osborne & Co., are working in the bed of the creek opposite Lincoln, and C. L. McKay & Co., and two or three other companies working on the bare, represent all the mining operations carried on below Lonisville. Some four or five companies are working between Louisville and Forest. Sam. H. Stuart and Peter Giroux & Co., one mile above Louisville, have the largest claims and are doing well.

At Forest, Messrs. Croker, Thompson & Co., bave completed a bed-rock flume and are sluicing off the old bar, some of which has been drifted out, but their prospects for making money are good. From Forest up to some distance above Mayville the creek is wide and from 67 up to 79 the flat is full of sbafts, and work is going on night and day. Just bow much the claims are paying we did not learn, but the number of men employed satisfied us that the ground was holding out good as last year. Further up Cedar several parties are engaged completing drains, and one and a half miles above Mayville, Messrs. Pearson, Hardy & Co., have struck favorable prospects, after more than a year's work. Should they realize their reasonable expectations, a dozen more claims will he speedily opened on the upper end of the creek; at

Snow Shoe,

Messrs. Shea, Merill & Co. have a large amount of ground, out of which they have taken $10,000 this year. They recently paid Stuart & Co. the sum of $2,000 for their claim, next below them, already worked out, for the privilege of using it as a dump, and expect to take out from $40,000 to $50,000 next year. As many of the residents of Cedar were over at the new mines on

Trout Creek,

We took the old Sunrise trail, eight miles over the mountains, and camped on 12 above Discovery on Trout, Wednesday evening, the 10th, and as Trout creek is attracting much attention, a few items in reference to tbe new mines will he of interest. Some time in the latter part of August, Messrs. Morse, Fox & Gibbons, while prospecting in the vicinity of Trout, discovered pay in a bar about nine miles above the mouth, and immediately prepared for work by setting their sluices and dumping their pay-dirt down the bluff some 18 feet through a chute. They have been making from two to five ounces per day, regularly, since they commenced washing, with only from three to four men. The course of the creek through the mountains is almost straight for 20 miles, and the bar on which tbe mines were found seems to bave forced the creek out of a straight course for a little distance, and is washed on three sides by the water. The opinion seems to prevail among tbe miners that tbe bar was once the bed of the stream, and as the gradual wearing down of ages took place, the water found an easier path around tbe head rock which forms the bed of the bar, leaving enough of ite treasures easy of access, to encourage the adventurous miner to seek for heavier deposits in its present bed.

With this view the creek was surveyed off in claims of 200 feet each, extending from summit to summit, and on Thursday, the 11th inst., 123 claims had been taken and four large companies had commenced work with a view of thoroughly prospecting the bed of the stream. The laws of the creek require one day's work a week on each claim or the payment of $5 per week into any one of the prospecting companies. This provision of the law enables miners to hold their ground until the creek is tested at a small expense, and the amount paid in by those not working will enable the prospectors to proceed with the work of development without involving themselves in debt. On No. 12 above Discovery, eighteen men are at work; they have a drain race ten feet deep and intend sinking with pump and wheel a large cut, and are confident that they can reach a depth of 25 feet within three weeks. They find a little gold in the gravel taken out of the drain and the gravel bears a close resemblance to that found on the Bar where pay is found.

Three other companies have commenced sinking below Discovery, the lower one on No. 72. This company has a favorable looking location and will thoroughly test it at once. The discoveries on Trout have caused but little excitement, owing to the fact that nothing is yet positively known as to whether the creek contains pay or not. But those who have engaged in the work of proving it have strong faith that it will pay. Some gold has been found in almost every one of its tributaries, and up some 25 miles from the mouth, on Freeze out. A company is now engaged putting in a bed-rock flume, and considers the enterprise a paying one, as the gulch has paid well in the past; two men have taken out as high as $700 in three days, shoveling into sluices. There are at the present time, about 1,500 inches of water in Trout, and the creek is over thirty miles in length. Should it prove good it would furnish employment for from one to two thousand men. While we would not advise a rush to Trout Creek, we would not he surprised to find it prove to be one of the richest and most extensive mining camps in the Territory.

Ancient Egyptian Mines.

Some of the iron mines anciently worked by the Egyptians have recently been discovered anew by English explorers, and search is to he instituted for other ancient mines of silver, gold and iron. As the processes followed in ancient times for the reduction of ores were very defective, it is expected that, in the *debris* accumulated in the neighborhood of the mines, an amount of the useful and precious metals will be found sufficient to make the working it over again profitable. At a recent meeting of the British Society of Antiquaries, mention was made of the discovery, in the neighborhood of Mount Sinai, of the turquoise mines of the ancient Egyptians. The discoverer, an Englishman, observed in water courses of that region which in summer are dry, peculiar blue stones which he soon ascertained to be turquoises. This circumstance led to further research. We are now informed that, "aided by the friendly tribes he has taken into his pay, he has discovered the turquoise mines of the ancient Egyptians, the rocks that they worked for the stones, the very tools they used, and their polishing and grinding places." The fortunate discoverer has already sent to England some of the finest turquoises ever seen.

While searching for tbe turquoise mines, the same explorer discovered the ancient lines of fortifications surrounding the works, and came upon the remaine of vast iron works, which must have employed many thousands of hands. Slag taken from the refuse-heaps around these works contains as much as 53 per cent. of iron. The whole surrounding district is well worthy of being thoroughly explored by the antiquary, as it contains many hieroglyphic inscriptions which would doubtless throw much light upon tbe early history of metallurgy.

One of the Lost Arts.—The new discoveries in Egypt will add plausibility to Wendell Phillips' lecture on "The Lost Arts." It now appears that the smelting of iron was carried on in Egypt from the very earliest period. Mr. Charles Vincent, in an English scientific journal, sets forth some new facts in reference to this subject: "In the sepulchres of Thebes may be found delineations of butchers sharpening their knives on round bars of iron attached to their aprons. The blades of the knives are painted blue, which fact proves that they were of steel, for in the tomb of Rameses III this color is used to indicate steel, bronze being represented by red.

An English gentleman has recently discovered near the wells of Moses, by the Red Sea, the remains of iron works so vast that they must have employed thousands of workmen. Near the works are to be found the ruins of a temple and a barrack for the soldies, protecting or keeping in order the workmen. The works are supposed to he at least 2,000 years old."

Harn on the Stomach.—Some time since the following method of destroying rats was reported to be in use in Germany. A mixture of plaster dust and dry wheat is mixed with oil of aniseed, and put in an earthenware saucer; and near by plenty of water is placed. The rats eagerly devour the mixture, and are straightway seized with tormenting thirst; they then, of course, greedily swallow the water. Upon this the plaster "sets," and becomes solid in their insides, and thus, more or less speedily, the poor creatures die in agony. The method described certainly has the merit of startling originality. There seems no reason why it should not prove a success, but it is to be feared that the rats will hardly appreciate the nice scientific points involved in the solidification hydrated calcic sulphate

A Substance which exudes from the earth in small quantities, at the head of the Coorong river, in South Australia, contains about seventy gallons of kerosene, thirty of lubricating oil, and seven of asphaltum per ton. The substance resembles asphalte. Tests show that the kerosene will not burn, except through a wick, until heated to 152 deg.—*Am. Artizan.*

Gold and Silver.

In the reign of Darius gold was thirteen times more valuable, weight for weight, than silver. In the time of Plato it was twelve times more valuable. In the time of Julius Cæsar gold was only nine times more valuable, owing, perhaps, to the enormous quantity of gold seized by him in the wars. It is a natural question to ask, what becomes of all the gold and silver? A paper read before the Polytechnic Association by Dr. Stephens is calulated meet this inquiry. Dr. Stephens says of our annual gold product, fully fifteen per cent. is melted down for manufacturing; thirty-five per cent. goes to Europe; twenty-five per cent. to Cuba; fifteen per cent. to Brazil; five per cent. directly to Japan, China and the Indies; leaving but five per cent. for circulation in this country.

Of the gold which goes to Cuba, the West Indies and Brazil, fully fifty per cent. finds its way to Europe, where after deducting a large percentage used in manufacturing, four fifths of the remainder is exported to India.

Here the transit of the precious metal is at an end. Here the supply is absorbed and never returns to the civilized world. The Orientals consume but little, while their productions have ever been in demand among the western nations. As mere recipients these nations have acquired the desire and habits of accumulating and hoarding—a habit common alike to all classes among the Egyptians, Chinese and Persians. A French economist says, in his opinion the former nation alone can hide away about $20,000,000 of gold and silver annually, and the present Emperor of Morocco is so addicted to this avaricious mania that he has filled seventeen large chambers with the precious metal. The passion of princes, it is not surprising that the same spirit is shared by their subjects, and it is in the predilection that we discover the solution of the problem as the ultimate disposition of the precious metals.

The absorption by the Eastern nations has been uninterruptedly going on since the most remote historical period. According to Pliny, as much as $100,000,000 in gold was, in his day, annually exported to the East. The balance of trade in favor of those nations is now given as $80,000,000.

Poisoning of the Atmosphere by Arsenic in Wall Papers.—The poisonous effects upon the air of rooms of arsenical pigments on wall paper have been generally ascribed to the inhalation of the dust, which was found to contain arsenic and copper, but cases of arsenical poisoning of this kind have occurred in which, on account of the moisture still present in the wall and the effectual fixing of the colors, this explanation will not answer. Upon these a recent series of experiments by Fleck throws some light. Air in glass receivers was subjected to the action of Schweinfurth green and arsenious acid by simply placing these substances beneath some bodies in a moist condition, and by applying them as a coating to others, with and without paper, potato and wheat starch being employed as pastes. After from eight daye to three weeks, in different cases, the presence of arseniureted hydrogen in the air was unmistakeably revealed by tests, and left no doubt that cases of chronic arsenical poisoning must he attributed not only to the mechanical mixture of arsenical compounds with the air of rooms in the form of dust, but also to the presence of this gas, resulting from the decomposition of free arsenious acid in Schweinfurth green. It was also found that the development of the gas is favored by moisture in the air and the presence of organic matter, especially that in the paste. Mold appeared on the paper in some cases, showing that arsenic is not a preventive of its formation, as often stated.

A Wrong Impression.—We have heard it said that there is an impression in Utah that more men are wanted in the Pioche mines. It is said that our want of miners is advertised there. The impression that we want more men is entirely wrong, as there are many good miners here now, and there have been many for some time past, unable to obtain work of any kind. If there are any advertisements in Utah, or any other place, to the effect that more men are wanted here, they are published by unprincipled men, who utter nothing but falsehood. We can hardly believe, however, that anybody does really try to induce working men to come here now; for we can see no object in it. When miners are wanted here, the fact will, we trust, he sufficiently advertised in the *Record.—Pioche Record.*

Postal Cards.—The British Post Office Department refuses to enter into any arrangement for the exchange of postal cards with the United States. They argue that "the use of postal cards is not popular among the English people; that even the lower classes are not induced to use them, although they are the cheapest, being jealous of any device by which their correspondence is open to public inspection. The British Post Office, therefore, prefers that the present rates of ocean postage should be maintained, and if postal cards are transmitted, they should be charged the usual letter postage rates."

Thirty Thousand medals were awarded to exhibitors at the Vienna Exposition, only 400 of which were to America. The quantity of goods and specimens which will be returned home from the American department is very small.

The Mining and Scientific Press Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the Press will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press i not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum. Single copies, post paid, 10 cents. Address

DEWEY & CO.,

Mining and Scientific Press and Pacific Rural Press Office, 338 Montgomery St., S. F.

A NEW BOOK.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 640 Pages and 81 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Six Years.

PRICE, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Address all orders (wholesale or retail) to

DEWEY & CO.
338 Mongomery street, San Francisco.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees: list of Goverment fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Home Inventions and Manufactures.

We condense the following from reports of the Sacramento dailies—*Union* and *Record:*

E. L. Brooks, Petaluma, patent gate—These gates were invented in Sonoma county in 1872. They are opened and closed by two handles or levers, one on either side. The gates open each in a different way, and can he opened and closed by the driver while seated in a buggy or in a two, four, six or eight-horse wagon. They are constructed in such a manner that they will stand all kinds of weather and never become affected by the shrinking or expanding of the woodwork. They are a complete guarantee against cattle and stock of all kinds, as they can be opened only by the handle or lever.

Laufkotter Bros. & Churchman, Sacramento—Horse power said to supply more water than four or five windmills even with the strongest wind.

Collin & Hill, Stockton—Portable fence which lasts ae long again as the ordinary plank fence, as there are no posts to rot off, there is no racking off of nails, as occnrs in the decaying state of the plank fence, and the more pressure you bring against it the firmer it becomes. It cannot he thrown down by wind or affected by breachy stock.

Heater and Cheese Vat.—J. S. Woolsey, of Gilroy, exhibits Woolsey's Portable Heater. This apparatus consists of a cylindrical heater, or boiler, which is alleged to be entirely free from danger from explosion, which supplies heat for cooking food for hotels or reetanrants or feed for cattle on farms. Fnel is economized and convenience secured by the inventor. Connected with the heater is a patent cheese vat, which is found to posses many special advantages.

Mammoth Milk Pan.—E. C. Smith, agent for the Pacific Coast, exbibits two mammoth milk pans, each of which is constructed in the form of a table about four feet wide and seven feet long. Beneath the pan is a chamher wbich is supplied with water for the purpose of cooling the milk which is poured into the mammoth pan. It is claimed that by the eubstitnte of this for the ordinary small milk pan, a much greater quantity of hutter is made, and that it is of altogether superior quality. Tbe work of taking care of milk and cream is diminished and the profits of the business increased.

Orchard's Post and Well Auger, Sacramento—Patented December, 1870, and improved and patented April, 1871. Claimed by the inventor that it will bore hardpan, gravel or any other soil, and the worst adobe as readily as any of them. For boring wells the anger is the same, except that for fastening together the different lengths of stems necessary to be added in deep boriug. When qnicksand is struck there is a portahle valve in connection with the anger that can be used and removed at pleasure. The cutters are made of the bost cast steel and will last the farmer several years in any common soil. The auger completes its work without the aid of a mud-pnnch.

R. L. Beamer, Yolo.— Cording's double horizontal hay press, patented in November, 1871. It is claimed to he a very important invention, as it combines all the qnalities for neat and substantial bailing with simplicity of arrangenent and unlimited power, applied by a lever working horizontally and pressing any given amounts of hay into bales of nniform dimensions. It is also claimed for this press that it will press nearly twice tbe amount of hay in the same time allowed any other press; that it is equally well done; that it is less cumbersome, being easily transported from place to place without loading or unloading as with upright presses, and does away with all high pitching and tramping. The trucks upon which these presses are mounted are similar in size to those commonly nsed under grain separators. No hard wood is needed in the construction of these presses.

Beet Sugar.—The Sacramento Valley Beet Sugar Company exhibits several barrels and half barrels of sugar, two grades of granulated, one of extra fine, one of crushed, and one of fine crushed. This establishment, whicb is located about three miles from the city, was started abont three years ago. The company has labored under tbe usnal difficulties which impede the progress of new enterprises, bnt perseverance has overcome all difficulties. This year the company has mannfactursd about two hundred thousand dollars' worth of sugar and has found a ready sale for its product. The field is open for many more beet sugar refineries in the State.

The Sweepstake Plow Co., of San Leandro, exhibited for the first time their patent "flexible" harrow, made in four parts to accommodate itself readily to the surface of the ground. Also, an iron frame single plow, carrying a vertical roller directly in rear of the coulter. Mr. Hill of tbis Co., also exhibited his well known Eureka gang plow.

Mattison & Williamson, of Stockton, displayed good specimens of their American Chief Gang Plows, wbich are not wanting in reputation where used. Their new style of hay fork seems unrivalled. They are a working and progressive firm who are constantly addding substantial improvements in their line of machinery.

E. W. Walton, Vallejo—Two plows, one for upland and one for tule. A tule horse-shoe made of iron so broad that tbe animal is enabled, without difficulty, to travel over swampy land. The size of the shoe is eight by ten inches and its weight about three pounds. There is also a sharpener for tule plows.

G. W. Haines, Binghamton, Solano connty—One gang plow, calculated for doing work of all kinde on level ground or otherwise. Its adjustments are so perfect that the driver, without leaving his seat, can go around hills and have hie sheare cnt an even depth, and that too without etopping his team. The plow possesses other advantages.

Treadwell & Co. exhibit a ten-foot single grain-header, manufactnred hy J. I. Case of Wisconsin, on parts of which California patents are held. Also, gang plows and other implements.

Baker & Hamilton made a very large display of agricultural implements.

M. C. Hawley & Co., exhibited various agricultural implements, including a new hay and straw cutter, the merits of which were shown by Mr. J. Kindleberger, a lively and pleasant agent.

Grinder for Harvest Knives.—Alexander Porter, of Woodland, Yolo Co., operated Connel & Sturgeon's grinding machine for reaper and mower sections. By a simple set of hinged gears movahle in various directions by hand, a small and ewift revolving emery wheel is made to rapidly grind the edge and point of the knives. It was simple, ingenious and very attractive to visitors.

Hucks & Lambert's Axle Grease was appropriately exhibited in large quantitiee. It is one of our earliest manufactnred articles in S. F., and one which has maintained its reputation to a significant degree. Mr. Hucks is an intelligent manufacturer and has invented improvements on which he might have made fortunes if he had patented them in season.

D. Lewie, of Los Angeles, exhibits one bale of hops weighing 200 ponnds. He raised this year 100 bales, of 200 pounds each. He has been engaged twelve years in raising hops, during which period the price has varied from 7 to 70 cents per pound. For eeveral years past the price of the crop has been remunerative.

J. Putnam, of the Mokelumne River, and R. J. Merkley, of Sacramento, also exhibit one bale of hops each.

Wax Work—The samples of wax work, by Madame Anna Getz Lucas, of S. F., seemed eqnal in quality to her display last year—which was the beet ever made in the State, if we are are not mistaken.

A large standard basket, containing thirty-five varieties of fruit, modeled from specimens exhibited here during last year'e Fair, may perhaps be considered her *piece de resistance.* Around this are clustered cherriee, plums, oranges, lemons, figs, apricots, apples and peaches, in rich and luscious profnsion. Tbese minor groups are studies from nature, being faithful copies of specimens furnished the artist by Messrs. Lewellyng, Runyon, Bird, Lnsk and Caesidy, all well known horticulturists of our State. The wax from Harbisons' Apiary, Sacramento, is used by the Madame in her fruit pieces.

Ryder's American Fruit Dryer, exbibited by Keeler, Hine & Thomae of this city, is worthy of thorough attention by fruit growers in California. It is intended to prodnce a qnality of dessicated fruit superior in eome respects to that dried by the Alden patent process. The machine is about five feet high, three in width and ten in lengtb. The sieves on which the fruit is placed are moved np an incline through the heated air and dried quickly. We should like to illustrate thie machine for the benefit of our readers. It deserves more attention, we believe, than it receives.

Finger Bar for Harvester.—We were told this is an excellent improvement by a farmer who used it through this season. The inventor, C. A. Smith, Dixon, Solano connty, says, among other advantages, "they can be attached to any barvester. By being inclined from front to rear all the short heads are saved by falling down, a clear distance of half an inch, over the knife, (which is placed directly on top of the bar instead of being rabbited in, as is the case with other bars) thereby eaving from 100 to 150 pounds per acre, which amount in a day will more than pay for the cost of the bar. From the back of the knife to the draper the bar inclines an inch, making an inch and a half of incline from the draper to the top of the knife. If the inventor will send ns his engravings we will illustrate them in tbe Press, for we believe he has an article which will help our grain cultivators.

A Tule Sod Cutter, invented and patented by J. Poole, a practical farmer, near Rio Vista, Solano Co., elicited favorable comments. It has been improved hy himself and is now said by Mr. Poole to be a desirable and successful implement. A series of circular knives some 8 inches apart is followed by another series cutting the sod midway between the first, making the cuts some 4 inches apart. The frame of the 2d series is hinged to the carrying frame of the first. Passing over the ground twice at right angles the sod is cut up into small sections of from 3 to 4 inches in size, rendering the subsequent work of the plow decidedly easy.

A Polishing and fluting iron for family use was exhibited by Weister & Co. S. F. It is of Eastern make, partly of brass and well finished. Visitors examiued it with interest, as a novel and useful combination implement.

A Vibrator Thresher was exhibited by M. C. Hawley & Co. We should be pleased to hear from farmers, who have used this new machine sufficiently to test its merits, as to its adaptability in California, etc. If some farmers well versed in the different agricultural machinery sold on this coast would write for the Rural unprejudiced articles, comparing the merits of different implements, they would do their brother farmers a great benefit.

Artificial Marble.—The Manhattan Marble Company exhibite a fine collection of artificial marble, embracing five mantel-piecea, four table-tops, and other articlee of emaller size. Thie company is located in Oakland, and commenced operations some five or six months ago. The marble is mannfactured of the best English cement and other ingredients. The material appears to be as hard and strong as natural marble, and is eusceptible of an equally fine polish. The mantels exhibited are of variegated color, and imitatione of Irish black, Lisban, Tennessee and French marble. As all the work is cast in molds, it can be furnished at lower rates than correeponding work wrought with the chisel. This is the first exhibition made by the company on the Pacific Coast. Among other articles in the collection are a number of white and black tile, which present to the eye the appearance of genuine marble.

Angora Robes and Mats. — Joseph Eberhardt, of the Santa Clara Tannery, engaged some three years ago in the manufacture of buggy robes, parlor mats, etc., from Angora goat skins. He now exhibits over 100 specimens of his handiwork. Some are prepared in the natural color, pure white, others are beautifully colored red, yellow, blue, purple or other shades. They are elegant articlee for the purposes for which they are designed, and especially those which are made from the finer fleeces. This is, we believe, the first time that these articles have been exhibited at any State Fair.

Portable Carriage Top.—Among the curiosities of the lower hall is Sargent's improved portable carriage top. This is an ingenious contrivance, constructed on the umbrella model, which may be taken down and folded up at the will of the driver. The entire apparatns weighs but eighteen or twenty pounds, and is constructed at a much less cost than an ordinary buggy top. It is easily attached to buggy, wagon or sleigh. The invention is of recent date, the inventor having just arrived with it from the East.

Glass Works.—Tbe San Francisco Glass Works exhibited an admirable collection of glaeeware, embracing demijohns, wine bottles, preserve jars, pickle jars, fruit jare. Bottles or glassware for special purposes are monlded with the name on each bottle or jar of the firm for whose use they are designed.

C. V. B. Reeder, San José exhibits Reeder'e patent suspension vibrating spring bed bottom. Thie is a bed consisting of a seriee of epiral springs as in the ordinary spring mattress, held together and in place by wire couplers, those on tbe sides being hooked into screw-eyes on a wooden frame. The springs rest on no frame work, but are upheld solely by the tensile power of the conplers. Thue all the springs are literally suspended in mid-air and the whole bed vibrates and gives at once. The advantagee claimed for this bed bottom are that presnre on one spring becomes equalized among all, the whole bottom yielding to the pressure. A stroke upon one spring vibrates to the most distant one. If a heavy person sleeps on one side and a light one on the other, the heavy one will not depress his side alone but the entire surface, and the light one will not be rolled down upon him. The bed ie open and hence cleanly. There are no cords to break, no wooden slats to warp, no single spring to grow week. By a simple nnhooking of the conplers a single spring may be removed instantly without the position of any other spring being affected. These and other advantagee are claimed for this bed. Reeder & Haller now are the proprietors, and manufacture at San José.

Cook's Water Filter, invented and patented by Matthew Cook, of Sacramento, ie on exhibition and in nse in the Upper Hall. Hnndreds of visitors have partaken of water from it, which is as clear and pure as water from any natnral spring. The filter is constructed with two wooden tanks. The lower one is partially filled with sand and the upper one with alternate layers of gravel and pulverized charcoal. The water is introdnced in the hottom of the lower tank and forced to the top and passee by a pipe to the top of the npper tank. From tbis it is drawn throngb the charcoal and gravel. The smaller sized or family filter clarifies 150 gallons per day. A number of them are already in nee. The work aimed at is certainly most successfully accomplished, and the inventor claimed tbat the apparatns is kept in order more easily than any other of its class.

Kew Liquid Measure.—J. H. Corliss of Reno, Nevada, has on exhibition a vessel for measuring and drawing off liquide of an inflammable nature. The lower part of the inside is so constrncted that jnst the amonnt required can be drawn off and no more. This is effected by tbe moving of a lever to or from the required amount, and it can be operated in the dark as well as in daylight. There is no waste by overrnnning or slopping over, and there is no loss from evaporation. It is made of galvanized iron. Several measures can be filled at once.

The California Powder Works show several samples of sporting and blasting powder, made at their works in Santa Cruz county.

Waterhouse & Lester have a fine assortment of carriage hardware, wheels, hube, spokes, seate, etc. Aleo a portable bnggy or wagon shade, in the shape of a large umbrella, which can be adjusted at will. It is useful and cheap.

The Sluthour Pump, exhibited by Capt. Keeler, of 727 Market st. S. F., attracted much attention. It was exhibited last year ae the Eureka pump, and has been described in the Press.

Patent Pan and Milk Cooler.—Exhibited by E. C. Smith, cor J. and 9th streete, Sacramento, seems worthy of the attention of dairymen. There are four in a set, setting the entire milking of the dairy in one pan. They are so constructed that there is a chamber between two bottoms, throngh which a body of water ie kept constantly runniug, thereby keeping the milk at an even temperatnre throngh all eeasons, and at the same time supplying a warm, dry room, with all needful moisture. After the cream is taken off, by drawing a cork from the bottom of the pan, the milk is discharged through a pipe to a vat outside, and the pan cleansed without moving from the room. The pans are thoroughly japanned in their watercourses, so that they will neither corrode nor rust.

J. S. Woolsey, Gilroy, besides hie portable heater for dairymen, exhibited a patent cheese vat. We believe both articles are desirable ones.

The Kifider Tire Regulator.—W. W. Bolton, agent, exhibits the Kifider tire regulator. For tbe purpose of tightening the felloes in an ordiuary wagon or carriage wheel an iron fixture is eet in the felloes in two places in each wheel, which ie easily tightened by a screw. When the tire becomes loose the necessity of resetting it is obviated by the use of this apparatus, as the felloes are tigbtened and expanded to the requisite degree. An iron washer is alse used for the end of the epokes when required. The invention is simple in its operatione, and appears to be one of great utility.

H. N. Miner of Sacramento city exhibits a patent conical tin pipe or flue, which is eet in any wash-boiler. The steam is conveyed to the top and discharged by six or eight tubes among the clothing. The action of water and steam washee the clothing without rubbing.

J. H. Corliss, of Reno, Nevada, exhibits an ingenious invention for measuring and drawing liquor. A tin cylinder or tank is so arranged as to fill several chambers at the bottom with a pint, a quart, a gallon, etc., respectively. By a simple motion of a lever on the top the supply of liquor is shut off. The vender may with safety set one or several regular measures under the proper faucet and leave them without danger of lose of liquor. Each measure is filled and the flow ceases. For drawing syrup, which runs slowly, this invention would he especially useful. The apparatus can be used as safely in the dark as in the light.

J. Brazee, of Alvarado, exhibits an automaton clothes line reel. It consists of an upright wooden chamber, with a weight in the lower end. The clothes line is drawn from the opening at the upper end and extended wherever it is needed for use. When out of use and lowered, he winds up the line without any effort on the part of the person nsing it. This fixture is stationed at any convenient point in the yard, and the line is kept sheltered from sun, wind and rain, except when in use.

Oliver Hyde, of Oakland, exhibits the rotary cutters used in his steam plow, of which we shall have mnch more to say hereafter.

Miscellaneous.

The California Silk Manufacturing Co. of S. F., throngh Brown & Peabody, agents, exhibit a splendid collection of spool and machine twist silk, tram and organzine. They have four cases of spools, containing nearly 100 shades of colors, and two small cases of button-hole silk. The colors are exceedingly beautiful and the thread is of superior quality. This company commenced operations nearly three years ago at South S. F. For a time great difficulty wae experienced on account of scarcity of funds and the difficulty of obtaining skillful and reliable artizans. These difficultiee have all been overcome and the business of the Company is now in a proeperous condition. Their prodnctions have earned a high repntations in the markete of the Pacific coast, and another new branch of indnetry is permanently established in the State. The bnlk of the raw silk used comes from China, as the State has so far failed to produce any considerable quantity of that material.

Joseph Green, of Oakland, exhibits a fine collection of silk ribbon of his own manufacture. Having had long experience in the silk business, he left the State eight months ago for Enrope for the pnrpose of bringing out looms, etc., to establish the business in this State. Abont five months ago his looms were set in motion. He exhibits a large number of ribbons of a dozen different colors and varying from one to eeven inches in width. They present a very beautiful appearauce, and for strength and durability excel those of Eastern manufacture generally in use. This enterprise has not been so well encouraged by San Francisco dealers as it should he, for the very reason that the goods are too substantially made to be sold as low as lighter and cheaper goods. They can be furnished as low as goode of eqnal quality from the East, but althongh all admire them, cheaper goods are too often preferred. The enterprise appears to be well worthy of the eupport of the public.

Fruit Drying Machines.—D. Titcomb, of Oaklaud, exhibits one of Moffatt's fruit drying machines. Thie ie the same dryer described in our report of the Oakland Farming Clnb. It is a cheap and simple machine. No. 1 will dry about 1,000 pounds of fruit in twelve honrs; No. 2 will dry about one ton, and No. 3 abont one and a half tons in the eame space of time.

Bartholemew Essto shows a California invention. It ie a vegetable slicer, consisting of

a revolving bottom to a small vessel which carries a knife. The vegetable is held against projective, and pressed upon the bottom. The other hand turns a crank, which revolves the bottom. The same power turns a small grindstone for knives, and a coffee mill attachment. It is a really useful machine for the kitchen. He also shows a new joint for uniting timbers, and a new style of extension compass. He exhibits, also, a new style of lifting power, which consists of a heavy perpendicular shaft, attached to a circular plate, the under face of which has two circular inclined planes. A plate corresponding to this rests on a cross-bar beneath. A pivoted bar has wheels above and below between these plates, and running on the inclined planes; when, by levers, the pivoted bar is turned, the wheels run up the inclines, and the shaft is forced upward. When the incline hight is accomplished, the shaft is wedged up by side notches and a key, and the lower plate and bar elevated and held by catches in an upright frame, till the wheels again apply and a new lift is made.

NASH, MILLER & Co., of Sacramento, exhibited three of the Cutts & Miller grain cleaners of different sizes. These fans have been extensively used for the past few years. They clean from 40 bushels to 250 bushels of grain per hour, according to size and motive power. There are 900 of them in use.

M. S. BOWDISH, of S. F., exhibits one feed mill, designed for the use of farmers. It is driven by wind, water or horse power, and is designed for grinding grain for feed or for the manufacture of cornmeal or graham flour. The grain is ground by two plates of hard steel. A pair of these will grind as much grain as a pair of burr stones with one dressing. The plates are replaced at less cost than is required for dressing the stones. Mr. B. also exhibits a simple and portable apparatus for forcing water for sprinkling plants, washing windows, buggies, etc.

Asiatic Cholera in China.

ALMOST EVERY CASE CURED WITH

PAIN-KILLER!

DEAR SIRS: During a residence of some ten years in Siam and China, as a missionary, I found your Pain-Killer a most valuable remedy for that fearful scourge, the Cholera.

In administering the medicine, I found it most effectual to give a teaspoonful of Pain-Killer in a gill of hot water sweetened with sugar; then, after about fifteen minutes, begin to give about a tablespoonful of the same mixture every few minutes until relief was obtained. Apply hot applications to the extremities. Bathe the stomach with the Pain-Killer, clear, and rub the limbs briskly. Of those who had the Cholera, and took the medicine faithfully, in the way stated above, eight out of ten recovered.

REV. R. TELFORD, Missionary in China.

DEAR SIRS: During a long residence in China I have used your valuable Pain-Killer, both in my own family and among the Chinese, and have found it a most excellent medicine. In the summers of 1862 and 1863, while residing in Shanghai, I found it an almost certain cure for cholera, if used in time. Indeed, using it in a great many instances, I do not remember failing in a single case. For three years I have been residing in this place, more than fifty miles from a physician, and have been obliged often to fall upon my own resources in cases of sickness. The Chinese come to us in great numbers for medicine and advice. Though without medical knowledge ourselves, the few simple remedies we can command are so much in advance even of their physicians, that we have almost daily applications. We allow them to come, because it brings us in contact with them and opens a door of usefulness. In diarrhea, colic, vomiting, cholera, coughs, etc., your Pain-Killer has been my chief medicine. Yours, very truly,

REV. T. P. CRAWFORD, Tungchow, China.

Those using Pain-Killer should strictly observe the following directions:

At the commencement of the disease, take a teaspoonful of Pain-Killer, in sugar and water, and then bathe freely across the stomach and bowels with the Pain-Killer clear. Should the diarrhea and cramp continue, repeat the dose every fifteen minutes. In this way the dreadful scourge may be checked and the patient relieved in the course of a few hours.

N. B.—Be sure and get the genuine article; and it is recommended by those who have used the Pain-Killer for the cholera, that in extreme cases the patient take two (or more) teaspoonfuls instead of one.

The PAIN-KILLER is sold by all the Druggists and Dealers in Family Medicines.

☞ Price, 25 and 50 cents and $1.

PERRY DAVIS & SON,

Manufacturers and Proprietors, 135 High street,
oc11 Providence, R. I.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

L. P. MCCARTY—General Agent.
A. O. KNOX, City Soliciting and Collecting Agent.
W. H. RATTENBERRY—Onlifornia.
F. G. SAOKET—Northern California.
FRANK CHAPIN—Oregon and Washington Territory.

RAPID CONSUMPTION IS OFTEN the penalty of trifling with a severe cough, but no such a catastrophe can occur if *Hale's Honey of Horehound and Tar* is taken before the disorganization of the lungs has commenced. Take time by the forelock and you are safe. Crittenden's, 7 5th Avenue. Sold by all Druggists.

Pike's Toothache Drops cure in 1 minute. *

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE Co. J. B Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

A LARGE SHIPMENT.—Three car loads of the Guild, Church & Co. pianos arrived for the agent, M. Gray. The fact of their being sold by Mr. Gray is alone sufficient guarantee of their superiority. *

CONTINENTAL LIFE INSURANCE Co., No. 302 Montgomery street, corner of Pine, San Francisco. *

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, and the ILLUSTRATED PRESS. Experienced canvassers preferred. Good men can make large wages, besides learning much and improving their talents.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Bunker Hill Quartz Mining Company.---

Office, No. 19 First street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of September, 1873, an assessment (No. 10) of ten dollars ($10) per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 19 First street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on Monday, the thirteenth day of October 1873, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on Monday, the fifth day of November, 1873, to pay delinquent assessment, together with costs of advertising and expenses of sale.

WALES L. PALMER, Secretary.
Office, No. 19 First street, San Francisco, California.

SPECIAL NOTICE.

At a meeting of the Board of Trustees of the Bunker Hill Quartz Mining Company, held this day, the assessment No. 10, levied June 5th, 1873, for ($10) ten dollars per share was rescinded.

Any stock upon which said assessment has been paid shall have the amount so paid, credited upon Assessment No. 11.

WALES L. PALMER Secretary.

Buena Vista Petroleum Company.---Location of principal place of business, San Francisco, State of California. Location of works: Buena Vista, Kern county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of September, 1873, an assessment (No. 17) of one dollar per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 430 Jackson street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 24th day of November, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

L. AGUAYO, Secretary.
Office, No. 430 Jackson street, up stairs, San Francisco, California. se27

Cincinnati Gold and Silver Mining Company—Principal place of business, San Francisco, California. Location of works, Kelsey Mining District, El Dorado county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of September, 1873, an assessment of Fifty Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 331 Kearny street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 20th day of October, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 10th day of November, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

WILLIAM SMALL, Secretary.
Office, Room 14, No. 331 Kearny street, San Francisco, California. se20

California Silk Manufacturing Company---

Location of principal place of business, San Francisco, Cal. Location of works, San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the 29th day of August, 1873, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Directors, made on the 29th day of August, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, No. 569 Market street, San Francisco, Cal., on Monday, the 20th day of October, 1873, at the hour of 2 o'clock P. M., of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of sale.

D. M. BOKEE, Secretary.
Office—569 Market street, San Francisco, California. oc4

Equitable Tunnel and Mining Company—

Principal place of business, No. 35 New Merchants' Exchange, San Francisco, Cal. Location of works, Alta City, Little Cottonwood District, Utah Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh day of October, 1873, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, No. 35 New Merchants' Exchange, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the tenth day of November, 1873, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Monday, the first day of December, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CHAS. S HEALY, Secretary.
Office—No. 35 New Merchants' Exchange, San Francisco, California. oc11

Eureka Mining and Smelting Company—

Location of works, Eureka County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment, No. 2, levied on the 21st day of August, 1873, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 21st day of August, 1873, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, No. 217 Sansome street, San Francisco, California, on Monday, the 13th day of October, 1873, at the hour of 12 o'clock M. of said day, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. P. BEACH, Secretary.
Office, No. 217 Sansome street, San Francisco, California. se23

Gold Run Mining Company—Principal

place of business, San Francisco, Cal. Location of works, Nevada county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of September, 1873, an assessment of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, corner of Market and Spear streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of October, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 10th day of November, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

C. C. PALMER, Secretary.
Office, corner of Market and Spear streets, San Francisco, Cal. se16-s&d

Homiguera Mining Company—Location

of principal place of business, City of San Francisco, California. Location of works, San Antonio District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held the 29th day of July, A. D. 1873, an assessment (No. 7) of three dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of L. L. Robinson, President, No. 603 Washington street, corner of Montgomery street, in the City and County of San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 5th day of September, A. D., 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 27th day of October, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JOSIAH H. APPLEGATE, Secretary.
Office, room No. 2, No. 729 Montgomery street, San Francisco, California. aug 2.

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Saturday, the 4th day of October, 1873, and the day of sale of delinquent stock is hereby postponed until Monday, the 27th day of November, 1873. By order of the Board of Directors. HENRY PICHOIR, Secretary pro tem.
Office, No. 603 Washington street, San Francisco, Cal.
San Francisco, Sept. 1, 1873.

REMOVAL.—Office of Homiguera Mining Company is removed to office of L. L. Robinson, No. 603 Washington street, corner Montgomery, San Francisco, Cal.
HENRY PICHOIR, Secretary pro tem.

Hayden Hill Mining Company—Location

of works, Hayden Hill, Lassen County, California. Principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of September, 1873, an assessment (No. 1) of fifteen cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 331 Montgomery street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 14th day of November, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 19th day of December, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. W. H. KNIGHT, Secretary.
Office, No. 331 Montgomery street, San Francisco, Cal.

Ida and Rhoda Lewis Consolidated Mining Company—Principal place of business, San Francisco, California. Location of works, Wallapai Mining District, Mohave County, Arizona Territory.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1), levied on the 28th day of August, A. D. 1873, the several amounts set opposite the names of the respective shareholders as follows:

Machinery.

Parshall's Lubricator for Steam Engines.

These Lubricators are suited to all steam Engines, delivering the lubricant, whether tallow or oil to every kind equally well. They are subject to be placed in the steam pipe, steam chest cover or the cylinder head, as is desirable. They admit the steam freely to the lubricant, which is constantly saturated with it and kept thereby in a free liquid state. When condensation of the steam begins, the water settles below and raises the oil to the top. The oil is fed from the top of the cup, through a tube which passes down through its center. All sediment in the oil settles to the bottom of the cup, and the oil, on going to feed the engine, is always pure. By simply turning a screw in the top of the cup, the flow of oil is regulated to suit the requirements.

We have numerous testimonials from Railroad Engineers and others, speaking in the highest terms of their superiority. The first one put in use on this coast is at the Pacific Saw Manufactory in this city. Parties desiring further information will please send for descriptive circular and price list, or call at our office.

10v27tf No. 32 FREMONT STREET.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

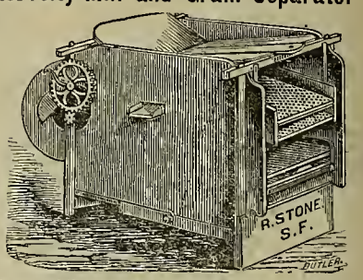
For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.

Dutch Flat, August 1, 1873. 6v27-2m

THE PATENT

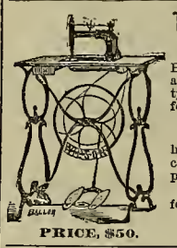
Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

R. STONE,
3v6-3m-eowbp 422 Battery street, San Francisco.



The New Wilson SEWING MACHINE

Has points of superiority over all others. A reliable warranty is given with each machine for

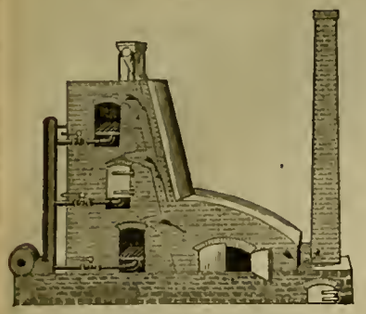
Metallurgy and Ores.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottome, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates, for Saving Gold.

Of all sizes and in any quantity, furnished to order. Full instructions sent for operating. Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work re-plated.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Sinking, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel; L. I.
Mese. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.

Any stock upon which this assessment shall remain unpaid on Saturday, the twenty-fifth (25th) day of October, A. D. 1873, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Tuesday, the twenty-fifth (25th) day of November, A. D. 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

O. J. EATON, Secretary.

Office, Room No. 12, Express Building, San Francisco, California. sep13

Stevens Pacific Smelting and Mining Company—Principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Directors held on the 11th day of September, 1873, an assessment of ten cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at 320 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of October, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the third day of November, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. M. KNIGHT, Secretary.

Office, 320 Montgomery street, San Francisco, California.

Sapphire Silver Mining Company.—Location of principal place of business, No. 438 California street, San Francisco, California. Location of works, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of September, 1873, an assessment (No. 2) of twenty cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 438 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of October, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 30th day of October, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

JOEL F. LIGHTNER, Secretary.

Office, No. 438 California street, San Francisco, Cal.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgist's Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by DEWEY & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

GRATIFY YOUR FRIENDS AND ACCQUAINTANCES by sending them an occasional copy of this paper. Persons in the Eastern States, or in other countries, will find much that is novel and fresh to them in its contents.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. 1amlbp

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 2,000 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $600.

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

TO FOUNDRYMEN AND MACHINISTS.

FOR SALE,

THE NAME, BUSINESS, GOOD WILL, PATTERNS, Drawings, Order-Books, Lathes of various sizes, from nine feet to sixteen-inch swing, Drill Lathes, Slotting Machine, Boring Bars, Engine, Line Shafting and Pulleys, Cranes, Cupola, with a general and fine assortment of Small Tools of one of the oldest established Foundries and Machine Shops in the State, including lease of ground; sufficient to carry on a large business if desired.

Apply at 135 and 137 Fremont street, San Francisco. oc11-2t

Patent Tooth Circular Saws.

They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect.

Particular attention paid to construction of

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices.

HALLIDIE'S Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mills, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 944.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest ratee. A. S. HALLIDIE 113 and 115 Pine St.

SAN FRANCISCO, SATURDAY, OCTOBER 18, 1873.

VOLUME XXVII. Number 16.

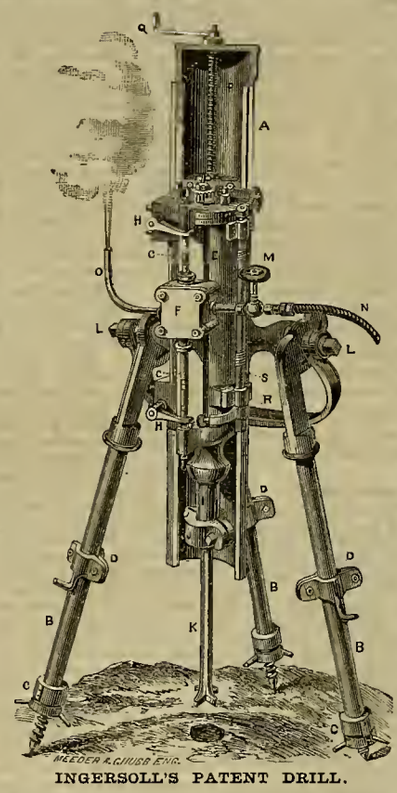
Ingersoll's Patent Rock Drill.

No single instrument in the business of quartz mining economizes labor to a greater extent than a good drill. It is the one article that miners have for years regarded as a desideratum, the key that has unlocked more treasure in a shorter time and with less expense, than any of the other numerous contrivances, which from time to time have been introduced to facilitate the laborious process of quartz mining. Many are the patents and multiform the patterns of drills that have been invented. Very few of them have outlived a year of service. Those that have stood the test of experiment have generally been too cumbersome or too expensive for common use. The objection of weight and complications have been overcome by a drill recently invented by Mr. Ingersoll, and now on exhibition in this city. The accompanying cut is a representation of the machine. Its chief merits are its compactness, strength, simplicity and lightness. It is convenient, easily handled, capable of great execution and not liable to get out of order. It is worked equally well by steam or compressed air. One only of the number now in use has had any repairs put upon it and that only after six months steady work.

The main elements of the drill are the frame, the cylinder and the piston. The frame is merely a trough with ways on either side, in which the cylinder by means of a feed screw and an automatic feed lever, is moved forward as the drill cuts the rock. The piston moves back and forth in the cylinder in the same manner as the piston of an ordinary engine. The drill point is attached to the end of the piston, which is a solid bar of steel. The piston is rotated, as it moves back and forth, by ingenious and simple mechanism. The forward motion of the cylinder in the trough is regulated by an automatic feed as the rock is cut away; the advance being more or less rapid according to the nature of the rock. By this means the drill point and solid steel piston alone receive the shock of the blow. When the cylinder has been fed forward the entire length of the feed screw, it may be run back and a larger drill point inserted. By referring to the cut, the details will be apparent. *A*, is the cylinder works; *B*, *B*, *B*, the legs of the tripod; *C*, *C*, the screw for adjusting length of legs to uneven surface of ground; *D*, *D*, *D*, are hooks clasped on each leg upon which weights hang when in use; *E*, is the cylinder; *F*, steam chest; *G*, *G*, valve stems; *H*, *H*, tappet arms moved by action of piston on cams in cylinder; *I*, is the piston; *J*, the clamp for connecting drill point to pistou; *K*, the drill point; *L*, trunnions which support the frame on the tripod; *M*, valve to regulate feed of steam; *N*, feed pipe; *O*, exhanst; *P*, feed screw; *Q*, crank on feed screws, for raising cylinder or frame; *R*, feeding tappet, working the arm of rod, *S*, which feeds cylinder arm by means of the pawl and ratchet wheel on top of the cylinder, working in *P*.

In several tests during the past few months, this drill has been used with great success upon the hard metamorphic sandstone, at French Corral, Nevada county, in this State. Under a pressure of 30 pounds, it is said to sink a 1¼ inch hole, to the depth of 12 inches in 10 minutes. The bits will average five inches, without sharpening. The strokes of the drill under this pressure, are 190 to the minute. By an ingenious peculiarity in the form of the cutting edge of the drill point, perfectly round holes are insured, thus giving a greater area to the hole and a larger percentage of powder at the bottom. The regular rotation of the drill insures the delivery of each blow at the point of greatest efficacy, each wing of the drill-point striking at a point just far enough in advance of the cut of the preceeding blow to chip away the rock lying between. With a pressure of 10 pounds, the blows of the drill would be equal to those struck by a 200 pound sledge in the hands of a man wielding it. Forty-six and eighty pounds pressure may be used with corresponding results. A great advantage possessed by this drill is its portability. It weighs but 140 to 490 pounds, according to size of cylinder and length of stroke, and is easily managed by two men. One of these may be seen in operation at Booth's Foundry. The general agent for the Coast, Mr. Wm. S. Pinney, 418 Montgomery street, will supply further information if desired.

The capabilities of this implement in boring the hard rock of the upper portion of New York city, are thus spoken of by a local paper. "During the short time that we spent at the works, we saw a large 3¼ inch hole carried down at the rate of 2½ inches per minute, and in boring an inch and a quarter hole in a hard mass of rock, the drill penetrated with as great rapidity as would an inch and a quarter auger in hard wood in the hands of a skillful carpenter. There was no hesitation, no getting out of order, no breaking down. The drill was placed in position in less than five minutes, steam was turned on, and the hole commenced with as much ease and regularity as attends any, even the simplest, mechanical operation.



INGERSOLL'S PATENT DRILL.

Discount on Silver.—The following Associated Press dispatch is dated New York, Oct. 11th. The effects of the general stringency the currency market have placed silver at a discount when sold for currency. The exact cause of this decline is not easily comprehended. Before the panic, silver was rated at a premium of 5¼ per cent., but the crash has had such a perceptible effect upon it that during the days of the crisis individuals offered it to dealers in large and small quantities for par, and in some instances at a fraction less discount for currency. Yesterday a Wall street firm doing a large business in the purchase and sale of gold and silver coin, absolutely refused to buy a lot of $10,000 worth offered them at par; currency was preferable for them to hold, and the time wasted in counting silver coin could be more advantageously used. A dealer said yesterday there was only about $10,000 worth of silver coin in New York. About this period of the year a certain portion of the quantity of silver in the home market is bought by silversmiths and jewelers for manufacturing purposes; but as their trade is dull, owing to the financial troubles, this portion of silver remains in the market.

The contributions among the miners for the benefit of the families of the men killed by the late explosion in the Yellow Jacket mine, reached quite a handsome amount.

A large lot of new machinery has been ordered for the Crown Point mine.

Indiana Gold Mines.

Every now and then we hear of gold finds in some of the Eastern States, but we hear of them only once or twice, when an ominous silence ensues, which, if occurring under similar circumstances in our "Land of Gold," would be a very strong indication that expectations were not realized. Indiana is the last locality heard from in this connection, and Mr. William Macy, of Mooresville, Morgan county, writes us that there are fair prospects for a rich gold field being developed in that section. About five miles from the town referred to begins a range of hills, extending southwest along White river to the southern part of the State, in which there are several places where minerals have been found. About six miles from Mooresville, southwest of the place, is a small creek in which gold has been found in considerable quantities, according to our correspondent. He says he has seen from twenty-five to two hundred colors washed from a pan of dirt or gravel; and it seems to be scattered in greater or less quantities for several miles up and down this creek, which is a tributary to White river.

Some prospectors have lately been at work on this creek and have met with pretty good success; but the scarcity of water prevents any extensive work. Mr. Macy says he has examined the field two or three times and has washed out quite a number of colors. He thinks hydraulic mining machinery would have to be used to make the mines pay. The hills are in some places covered with gravel and sand which could be easily washed down. In some of the ravines lumps of gold have been found, containing several dollars, and at the mouth of almost any of the gulches colors can be found. The richest land yet found is, however, about twenty-five miles southwest of Indianapolis. Some preparations are being made to wash out the gravel by parties there. They have built a dam, and intend washing on a small scale in what they call a "plaster mine," as soon as they can get water. Mr. Macy expresses his inclination to answer any questions concerning the locality which people interested may wish to propound.

Morey District.—We find the following item clipped from an exchange, which we are unable to name: Mr. L. A. Dochez, of the Morey Mill Company, arrived here yesterday from Morey, Nye county. He reports that the mines in that locality are turning out very rich ore, and that the mill which is being put up will be ready to run by the 15th of October. Several new ledges of which the croppings assayed into the hundreds, have been located by Mr. D., which joined to the 18 mines already developed by the Morey Mining Company, will keep the mill in lively operation.

Quicksilver.—During the past nine months $227,800 worth of quicksilver has been exported in steamers and sailing vessels from this port, besides what has been sent by rail.

The Eureka Mines.

We see by the *Sentinel* that the total bullion shipment from Eureka for September was 3,065,643 pounds, an increase of 633,051 pounds over the preceding month. Of this the Richmond shipped 1,860,000 pounds; the K. K. Consolidated, 475,000 pounds; Eureka Consolidated, 429,218; Ruby Consolidated, 237,323; and the Hoosac, 63,511 pounds. The result of the working of the Richmond Company's mine and furnaces during the month is said to be the greatest ever attained in the district, if not in that portion of the State. During this time the Ruby Consolidated was shut down after about the middle of the month and the Eureka Consolidated had but one furnace in operation. It is said the owners had more difficulty in finding teams to haul the bullion to the railroad than they had in getting the bullion. An increased yield is expected this month.

In this connection the following condensed statement from the annual report of the Secretary of the Eureka Consolidated mine will be of interest. The meeting was held in this city on the 13th inst., and the following Trustees were elected: Thomas Bell, James Findla, G. W. Kidd, W. H. Osgood and John W. Shaw. The financial exhibit of the Secretary was as follows:

RECEIPTS.

1,981 tons ore, product 1872	$653,656
2,339 tons ore, product 1873	878,788
Sale of Lookout mine	85,000
Miscellaneous	4,287
Total receipts	$1,631,731
Cash in hands Superintendent, Oct. 1, 1873	1,714
Overdraft Bank California, Oct. 1, 1873	3,558
Overdraft on bullion shipments	171,311
Total	$1,808,314

DISBURSEMENTS.

Construction and improvements	$ 9,953
Mine account	291,794
Smelting account	344,920
General expenses	25,214
Expenses at San Francisco	8,534
Interest on overdrafts and notes	28,494
Transportation and refining charges on bullion	289,511
Legal expenses	67,163
Dividends	200,000
Miscellaneous	43,944
Total disbursement	$1,308,637
Balance overdraft Bank California, Oct. 1, 1872,	169,328
Balance overdraft bullion shipments	328,589
Cash in hands Superintendent, Oct. 1, 1873	1,760
Total	$1,808,314

RESOURCES.

Cash	$ 1,760
Supplies at Eureka	14,607
Charcoal	9,908
888 tons base bullion, product 1873	288,625
	$314,899

LIABILITIES.

Overdraft Bank California	$ 3,558
Overdraft bullion shipments	171,311
Superintendent drafts, not presented	15,613
Bank accounts, not due	1,463
Bills payable	50,000
Total	$241,945
Surplus over liabilities	72,954

The cost of extracting and hauling 25,692 tons ore was $387,450, or $11.18 per ton, and the cost of smelting 26,155 tons ore was $480,-527, or $18.37 per ton. The reduction of 26,155 tons ore produced 3,227 tons base bullion, or 8.04 tons ore to 1 ton base bullion, the cost of producing the latter averaging $237.66, while the transportation and refining charges are about $78 more.

The death is announced of Miss Elizabeth Carne, a Cornish celebrity. She was for years a frequent writer in the London *Quarterly Review*. She was thoroughly versed in geology and mineralogy, and classified and arranged every specimen in the mineralogical museum of the Royal Geographical Society. A mineralogical museum of her own at Penzance is now nearly finished. In addition to her rare attainments, she was noted for great benevolence.

CORRESPONDENCE.

Quicksilver Metallurgy.

EDITOR PRESS:—Yours of Oct. 4th, 1873, contains an extremely funny article, written on a subject of which the writer is evidently entirely ignorant, or upon which he is *non compos*. It is of course the article on Quicksilver to which I refer. Such delicious nonsense has not even ever been ventilated by our native born "scientific cusses." One would think that the young man who wrote the article had really been engaged in quicksilver metallurgy, and that it had had its usual effect. But no, quite the reverse, he is still seeking the honor of making his first pound of quicksilver, and proposes to do it by means of a drawing some hundred feet in length. If drawing could do it, or rapid writing, no doubt Mr. Bankert—Hubert Bankert M. E—just installed Superinteudent Napa Q. M. Co. (bankrupt) would do it. But whether he will be able to "bring science to bear upon this subject" is so gloriously improbable, that "Quicksilver Metallurgy" need not be afraid of the burden. It is hardly worth while to pick the article to pieces; probably few will read it through and all will laugh that do. But just for fun, let us go at it.

"The present wasteful and unsatisfactory method of treating cinuabar demands an entire change." What general stuff in the face of experience! No such change is demanded; quicksilver is worked cheaper and to as high a percentage as most metals. "More than half the mercury in the ore is lost to commerce and every pound so lost is at least a dollar out of the pockets of the owners."

Sweet innocence! What refreshing coolness of one just hatched, and of one not so much as introduced into the business of making quicksilver! Poor fellow, half or more is lost? You have nearly guessed aright; you are only out 30 or 50 per cent. You must learn than the the world of mercury is not composed of old and new Almaden, whose figures you are using. Because Comstock ores only yield 65 per cent. of their value, you cannot say that silver is only extracted to that percentage.

But how the poor owners of mines are ont a dollar for "every pound" lost, is not so clear. No doubt the young man forgot that it might cost something to produce that pound. However, that was immaterial!

In regard to the percentage produced, the truth of the matter as demonstrated by competent authority—say by such men as Knox, Luckhardt, Osborne and Lockhart, is, that as high as 90 per cent. can be and is saved of the appreciable mercury in the ore. This holds good, especially on low grade ores, say from 0.5 to two per cent. And this, in what our facetious friend is pleased to term "open vertical furnaces." Not so, however, in the old retort furnaces. Here, the loss is so irregular and difficult to arrive at that "guesses" are better than tests, and are universally adopted, just as Mr. "Hubert Bankert M. E." does so persistently throughout his article.

We will have to skip over the following lines in the wonderful production, (20 of them, read them reader, but remember you were warned beforehand) they are too jumbled, not to say senseless. Although from an M. E., there certainly is no sense in them whatever, leaving it to the readers to decide themselves.

And now dear reader, prepare for a stunner: for it is a stunner sure! Friend Hubert Bankert, M. E., actually writes the following. You can find it in the number of this journal above given; page 210, line 26, *et seq:*

"The heat employed to reach the center of the lumps is in every case I have witnessed far too great; indeed, I have seen it as high as 2,000° instead of being under 700°, and a large portion of the mercury so liherated is destroyed for any practical uso before it enters the condensers."

Tell us, bright and brilliant star from the East—aye, "far East"—say somewhere from the tangled mountain sides and quicksilver mines in London; tell us, what is an element? He who can "destroy" an element, possibly can also change, transmute or make one. Perhaps our little joker "M. E." can make gold. Deal with him gently!

The following fifteen lines, commencing with "Again" etc., contain the sweetest mingling of two perfectly different subjects, that one can imagine. Poor boy! Go and ask Mr. Knox how many bricks he would have to work, to get enough quicksilver to salivate a grasshopper. Go and ask McQuaide, at Oakland, how many *furnaces* he would have to pound up and extract the quicksilver, to get enough money, to pay for the paper upon which your drawings are shown! "Hitherto the prevailing idea has been that space was the great desideratum for its condeneation; this is an error; no matter how small the chamber, indeed, the smaller the better, provided it is kept perfectly cold." Now for heaven's sake, who told you so? Tell him he is "a liar, a horse-thief," nobody that knows anything or is not an idiot, said, or has thought so.

But, Mr. Editor, as I am running into length; I'll skip another dozen lines, as too immense. But let us pick this gem!

"If furnaces are properly erected, there is no need of artificial draught; it would probably be more necessary to regulate the draught by dampers."

Of course! To be sure! Who would have thought it? Great God, what idiots our quicksilver people have been!

But now listen! Now for figures! "In our works alone, out of 1,600 tons worked in this way, only an average of 8¼ pounds per ton was obtained, where the ore treated contained by repeated assays from 20 to 80 pounds per ton. The loss was simply enormous." This is what Mr. Hubert Bankert, Mining Eogineer, by the grace of God, (certainly by an inscrutable Providence,) Superintendent of the company says. Young man, you have just come here; you may not know a thing about it, as you may have been deceived, but you certainly do not tell the truth by a long shot. Let me offer a little more correct version.

You are correct in some things; 1,600 tons is good; 8¼ pounds, per ton is scant; 20 to 80 pounds per ton is a downright constructive—well say—mistake. You should have said from 5 to 15 pounds; 80 pound assays may have been made, but they were few and far between. Angels' visits might even have relieved the tedium of the intervals!

Aha! Here we came to the "little joker;" he was hidden under a terribly thick hat! "My Plans" etc. For this then, everything being done, is "erroneous" "wrong" and "without science."

Gentlemen, you can find these "Plans" at the rooms of Mr. H. B—.,M. E., at the Cosmopolitan Hotel. To enable him to exhibit them, he has temporarily leased the hall also.

Young man, first go and learn, then go and learn again, then go and work, and learn and do what others know and do practically, and then experiment. By and by, make some plans.

Do not, as you love science, reverse the order. Don't help still further to damn "scientific cusses."

E. N. RIOTTE.

Oakland.

Notes of Travel in Nye County, Nevada.

(By Our Traveling Correspondent.)

Belmont,

The principal town in this county, is the county-seat; it contains about 250 inhabitants, some 3 lodging-houses, as many restaurants, and some 8 mercantile firms. It is located 85 miles south by east of Austin, and about 175 south of Battle Mountain, Nov., the point of divergence from the C. P. R. R.

The total distance from San Francisco, is 697 miles, and the fare $64.25. From Battle Mountain the travel is via O. Tuller & Co.'s stage line; there are fine four-horse coaches to Austin, and from Austin to Belmont there is Tuller & Cluggage's line of stages. The time occupied in transit between Battle Mountain and Belmont is 32 hours; fare, $30. Since I passed over this route, one year ago, the road has been shortened some 3 miles, and otherwise improved; so that there is less dust, shorter stations. The restaurants along the road are very fair, but they still adhere to '49 prices, one dollar per meal. The town of Belmont is located near the center what is known as

Philadelphia Mining District,

Comprising nearly all the mineral land of Nye county, which is one of the largest counties in the State. The proprietors of mines and mining operators, together with the business men of this district, feel hurt at the course of the press of this coast in general, from the fact that they ignore the Philadelphia Mining District, and always quote the news of all mines in, and around Belmont, as from Reese River District; the latter is a fine district of itself, and therefore should accord to the former its just due. The following shipments of bullion, for the first eight months of this year, will show that the mines are of some account; through the politeness of Mr. Geo. W. Emerson, Agent of W., F. & Co's. Express, I am able to give your readers the

Bullion Shipments from Belmont, Nev., for 1873.

1873.	No. of Bars.	Weight (lbs.)	Value.
January	34	5,229	$58,816,96
February	17	1,534	27,508.54
March	67	6,111	113,612.79
April	47	4,580	76,224.42
May	74	6,954	79,486.44
June	30	3,438	69,213.83
July	56	5,631	70,428.99
August	30	2,907	42,644.45
	355	34,334	$537,936.42

The mines of this district are as follows:

El Dorado South Cons. M. Co.

This incorporation's mines and mill are located one and a half miles east of the town of Belmont, in Nye Co., Nevada, and consist of the El Dorado South and Arizona mines, containing jointly 1,600 feet of location, running nearly north and south. On my visit last year the main incline shaft on the El Dorado South mine was down 440 feet on an incline of the ledge, which averaged about 30° to the eastward, with about 450 feet of drifts north and south from the different levels. Now the main incline is down 490 feet, at which point a drift is started both north and south on the course of the vein. Ore of a low grade is found at this point, but it is expected that when these lower levels are run to the point under which rich ore chambers did exist, that the same will be found again. The upper levels are still being worked, yielding some ore, the bulk of which, however, was extracted last year. It is very probable, indeed, that the ore body in this mine at greater depth will prove even richer than above.

A new boiler, 16 feet long by 52 inches in diameter, is just being put in position, to take the place of the old ones, now nearly useless. When in place, they will have an engine of 120 horse-power, and be able with this power to develop the mine to a depth of from 800 to 1,000 feet. This company is extracting about 25 tons of ore daily, of all grades, and working 70 men in all positions in and about the mine. They are now more particularly engaged in improving, tearing down, remodeling etc. Within a short time, however, they will be in position to take out more ore than double the capacity of their 20-stamp mill, which is located about one-half mile east of their hoisting works, on the El Dorado South mine. This mill has, as above stated, 20 stamps, six pans and three settlers, also a Stetefeldt furnace of the largest size. The capacity of their mill is about 22 tons daily (24 hours), employing 16 men. Their ore averages about $40 per ton in silver—that is, the free milling or second-class ore. The ore that is roasted will average probably $100 per ton, and runs as high as $120. Mr. John White, late of Grass Valley, is the general superintendent, and William Alperson, mining foreman. Under the present management things are receiving a general overhauling, and look rather lively.

Belmont S. M. Co.

The mines of this corporation consist of the Mouitor and Independence, containing jointly 1,400 feet of location, running nearly north and south, and located about 1¼ miles southeast of the town of Belmont. The country rock in this company's locations is slate, with an occasional put in of porphyry on the foot-wall. The ore body pitches to the east, at an ang'e of about 40°, running from 4 to 8 feet thick. This mine has two tunnels run in to intersect the ledge. No. 1 is in 280 feet, and cross-cut about 125 feet; No. 2 tunnel is in 527 feet, intersecting the ledge at a point 240 feet below the workings in tunnel No. 1. In this lower tunnel (No. 2) they have run a drift north 300 feet on the ledge and south 60 feet, showing plenty of ore of a low grade, which will mill from $40 upward. At a point 174 feet south of tunnel No. 2 they are engaged in sinking a vertical shaft, now down 94 feet, that will tap the water level at a depth of 200 feet; from there a drift run to the westward will bring them to the ledge at a distance of 184 feet. The principal object of this shaft is for deeper development, and to have less distance to elevate the water in the mine, which is in quantity in all the mines on this hill, at a certain depth. This shaft is 9 by 4 feet in the clear. There are are about 600 tons of ore on their dumps that will mill about $40 per ton. This company own a twenty-stamp mill, known as the

Monitor-Belmont Mill,

Located about three-quarters of a mile southwest of Belmont; which has a capacity to reduce, and is now reducing, 22 tons of ore daily (24 hours). This mill is dry crushing; has 7 pans and 5 settlers. Ores are being worked at this mill by the Rowe process, netting 90 per cent. of the assay value. The last 1,000 tons worked averaged $41 per ton in silver. The capacity of the two engines at this mill is about 45-horse power. One engine drives the battery, the other the pans. They work regularly 18 men. A fine Stetefeldt furnace is attached to this mill, but is not now used. The mill and mines of this company are superintended by Mr. Samuel McMasters, formerly of Bullionville, Nev., and the mill foreman and assayer is Mr. R. D. Millet. The management of this mill have invented something new for getting rid of the dust at a dry crushing mill, and turn the dust to a valuable account. It consists of a pipe 12 inches in diameter, extending from the Stetefeldt furnace to each of the batteries; the result is a strong current of air (that is naturally created by the hight of the furnace chimney) which attracts the dust from each of the batteries; and the greater part of it is carried from the batteries to the furnace. Every few days this pipe is cleared out by hand, requiring but a few moments. This simple contrivance saves this company about 8 tons of this dust monthly, which used to go to waste, into the machinery and the lungs of the workmen. This pays them as much per ton as the rock they crush—say $40, or an aggregate of $320 per month. An additional saving made by this contrivance in the consumption of oil alone, is ten cases per month. It was introduced here some eight months since. I noticed no more dust around the batteries of this mill than any wet-crushing mill I ever visited. I pronounce it a success.

Belmont Mining Company.

This Company's mines are located about half a mile to the east of the Monitor and parallel to it. The three locations are called the Highbridge, Transylvania, No. 1, and the Canfield and Transylvania, No. 1, containing, in the aggregate, 4,600 feet of locations. Mr. J. F. Cassell is Superintendent, and Joseph Pottbast is the mining foreman. Since my visit to this place last year, the hoisting works were completed on the Highbridge; but their hoisting apparatus, consisting of a bucket to hoist the water with, has proven to be of too small a size. At this writing, Sept. 17th, they are idle at this shaft, awaiting the arrival of a steam pump.

The incline shaft of the Canfield, that was down one year ago 300 feet, is now down 100 feet deeper, and they are now drifting on the ore-body from this point. There are

Other Prominent Mines,

Not now being worked, extending north from the above locations. This lode, known as the Highbridge, is traceable for from five to six miles, and some few years back some 15 or 20 locations were developed to from 20 to 100 feet deep each. Of the owners—some have died on the frontier unknown, others made fortunes elsewhere and will never return; and still others are too poor ever to get back. The mining laws of this camp will not admit of a relocation, unless an abandonment can be proven, which is a pretty hard job to do. So an immense amount of fine locations, (which in reality belong to nobody) are lying idle and cannot be worked by anyone, as there is no protection for the second parties. These prospects that were considered poor property ten years ago, because they would not net $300 or $400 per ton, when ores had to be hauled some 100 miles or over for reduction, are now valuable at any point above $35 per ton, as there are plenty of mills in the district. Prospects from the above, run over $100 per ton, and some 75 tons worked from them run from $50 to $75.

About two miles north of the town of Belmont, on this ore belt, is located the

Green and Oder Mine.

This mine is owned by four partners, P. Farrell, Thos. Warburton, Barney Mullen and John Grimes, and contains 1200 feet in the location. It has been worked up to within a few weeks, and is developed to a depth of 120 feet, following the ore body, which dips east at an angle of about 45°. The ledge matter between the walls is from 6 to 8 feet thick. About 30 tons of ore have been extracted from this mine, which averagod $300 per ton. Prospects have been taken from this mine ranging from $175 to $800 per ton, but there is as yet no fixed ore body in this location, as they are not down deep enough, although the walls, which are of slate with a heavy clay gouge, are just as smooth as glass, and there is every indication of a fine mine at a depth of, say, 200 feet. In a few weeks at most they will put a full force on this shaft to sink it to that depth. At present it is idle.

From Austin and Battle Mountain Districts in my next.

L. P. Mc.

Quicksilver Extraction.

EDITORS PRESS:—I notice in your issue of Oct. 4th an article under the above heading, advancing some new ideas and many old ones, which perhaps are new to many of your readers, as few except those particularly following that branch of industry can be expected to be up to the improvements made and making in that department of reduction. There are therein many scientific facts clearly stated, and some other things stated as facts to which I cannot assent, and must ask for proof.

It is asserted that the heat in the furnaces is often as high as 2,000°, which I believe is true, and that it is unnecessarily hot and a waste of fuel; but I cannot admit that any mercury is thereby destroyed. Furnaces using such a heat are badly constructed, or badly handled by the operatives. I have known cases where the ore was put into furnaces so fine that the fire could not penetrate the mass of ore, except near the sides of the furnace, and a great heat was kept up to heat the center of the charge, which would have been unnecessary if the ore was of such size that the fire could have passed through the ore as was intended, and as it must to be a success. Other furnaces are so constructed that the ore stays in the fire but a few hours, and to extract the mercury in the time it remains in a red hot state, it must be very hot or some mercury will remain in the ore when drawn from the furnace. I have seen the effect of this high heat in a semi-fluxing of the rock on the surface, thus shutting in the remaining mercury beyond the possibility of escape. But these cases are the abuse of the true principle of construction and working a furnace, and no argument against the furnace as an institution. You have found it very difficult to treat the soot, "even with the addition of lime or boiling." I should think it might be difficult to treat the soot by the latter process, but never having tried it, it is mere speculation on my part, but with lime and a little manipulating with the steam engine, we have no trouble or difficulty, nor loss of labor.

Another difficulty or danger in the way is given as "the facility of fracturing" the cast iron condenser in transitu from place of manufacture, to where used at the furnace. Now there have been one hundred and fifteen of these condensers, "of peculiar construction" made and put in operation in this State, and not one has been thus far broken, nor even fractured so as to prevent its being set in its place and successfully used.

And I will here state the reason why cast iron is preferred to wrought. The first cost is much less, and they will last twice, or thrice, as long. This double advantage is deemed sufficient to justify the risk of breakage.

Your correspondent asserts that a fan is used about many of these works, and puts forth a conundrum: "Why should this appliance be required here any more than in the deposition of arsenic?" Well, I give it up. But in the reduction of cinnabar by furnace, it is necessary to save the mercury, and to save the men who operate the furnace from its effects.

In a properly constructed furnace with a suction fan for an aid to the draft, there is no mercury escaping from the furnace or conden-

sers, even if there are defects, (unless very great ones, when they must be remedied), except through the fine prepared for them, and by this they are conducted far enough to leeward, to prevent their return to, or about the furnace.

It is well known to those engaged in the reduction of cinnabar, and to all scientific persons, that the vapors of mercury and sulphur are very heavy, much heavier than the atmosphere, hence they will not rise through a chimney unless quite warm, and the older style of furnaces all have a fire place about the chimney or near it, to aid the draft, or to produce the artificial draft objected to, and it is not an infrequent occurrence in such furnaces, that the vapors refusing to rise through the flue and chimney, force themselves through the condenser doors and drive the operatives from their work till the fire in the chimney produces the artificial draft. This work the fan does constantly, and renders it impossible for the vapors to break from their inclosure.

I have to frankly confess that I am one "of the adherents of this novel plan," and I claim to save about 99 per cent. of the mercury actually in the ore. When I say this, I do not mean 99 per cent. of some mythical amount obtained by operating with a few grains and a blow pipe or acids, from a piece of ore supposed to be an average of a lot. But I do mean this: that by "this novel plan," I will convince your correspondent or any one who will take the trouble to look into the matter, that the reduction of the ore is complete and not a trace of metal left in it; that there is nothing absorbed by the furnace; that there is no metal lost in the passage of the vapors through the condensers and flue until the end of the flue is reached. At the outlet some mercury escapes, and it is a question yet to be determined how far it is profitable to continue the traps in which we catch the mercury. That the "novel plan" is aiming in the right direction does not admit of a doubt, and if more condensers and other appliances are profitable, they are easily added. The offer heretofore extended to you and your scientific friend is extended to your scientific correspondent, that he can obtain ten dollars a pound for all the mercury he may save over and above one per cent. of the amount saved by the "novel plan" from the vapors sent forth from the coke chimney at the end of the flue. I also invite your correspondent to prospect the grounds around our flue, (we have no chimney) for a rich strike.

The operations of the furnace on the "Napa Mine," as described by your correspondent, are certainly a bad showing, and if that sums up his experience in furnaces, no wonder he prefers the "stage coach" retorts to the "railroad" furnace. That experience could put the richest mining company on this coast into bankruptcy, "the lo s stated" is so "enormous."

Retorts are proposed as a remedy for this enormous loss. Retorts in their place and for many uses, are better than anything yet devised to serve certain purposes. In the reduction of cinnabar they do the work well. But are they superior in the reduction of cinnabar to a furnace rightly constructed in the quality and economy of operation? I propose to take the negative on this question, and will give you my reasons therefor. To those unacquainted with this business, I will say the first item of this reduction is to reduce the ore fine, (the finer the better). This crushing must be done dry, or, if wet, must be afterwards dried before it can be put in the retorts.

This dry crushing cannot by any known process be done for less than $1.50 per ton, and most mill men put the cost higher. It then requires at least one barrel (200 pounds) of lime to each ton of ore, costing at the mines not less than $2 per barrel,—often more. For fuel and labor the cost per ton will not be less than $5, when done on a large scale, (and more on a small one), making $8,50 per ton. If your ore is rich, it will pay; if low grade, you must concentrate it at considerable cost, and some loss of cinnabar, for by no process of concentration can you save all the cinnabar, and the closer you concentrate, the greater the percentage of loss. Now this "novel plan" furnace will take the ore without crushing, and also take all the fine ore produced by a mine working in ledge without making an "adobe," and it can be reduced at a cost not exceeding $1.25 per ton of 2,000 pounds, so cheap that it is unprofitable to employ many "sorters" to break off the waste rock except the larger portions, it being cheaper to put a few tons of "waste" through the furnace, than to employ men to break it off. I speak of my own knowledge of the cost by the "novel plan," and of the best style of retorts heretofore used, and not of those soon to be patented by your correspondent, which he claims will reduce "72 tons every 24 hours, at a cost of $1.50 per ton."

Excuse me, Mr. Editor, for having used so much of your valuable space, but progress can only be made by an interchange of ideas. "Try all things—hold fast that which is good."

"Novel Plan."

Combustion of the Diamond.—An experiment lately made by Mr. Spence, of Manchester, seems to prove that under certain conditions the diamond is combustible at a much lower temperature than has been hitherto supposed. A South African diamond of the size of a small pea, coated with refractory clay, was placed in a crucible with a mixture of soda and hydrate of lime, and then heated in a muffle for three days and three nights. On opening the mass, it was found that the diamond had entirely disappeared, although the heat had never exceeded a cherry-red.

Mechanical Progress.

Wind and Water as Motors.

A writer in the *European Mail*, discussing the subject of wind and water as motors, says: In the case of a ship, there are two things to be considered. The pressure of the wind is of two kinds: 1. That upon the sails, which could be applied to machinery, and of which a certain proportion could be converted into energy, and applied to moving the vessel. 2. That upon the hull, rigging, &c., the total amount of which (added to the increased pressure by any supposed advance) must be deducted from that available for conversion. Mr. Schuckt gives his machine what Archimedes is said to have required in order to remove the world, *a point d'appui* outside of it. He had much better set about making a model which would realize some actual conditions, and tell us whether it has worked its way across a pond against the wind. When he can make such a statement, the matter will be worth inquiry as a mere interesting application of principals. Till then discussion is simply waste of time, because although the conditions are different from the usual perpetual motion nonsense (as it is not perfectly clear how large a proportion of the wind pressure could be applied to the machinery), yet it is perfectly certain that no practical benefit whatever could be obtained, and that such machinery would simply be an enormous outlay, made for the purpose of doing less advantageously what can be done already in a much simpler manner by means of sails. Of course, when a ship is working to windward, the pressure of the wind is really so applied as to overcome itself, and give a surplus energy; and this is effected by means of the friction of the water and the hull. Mr. Schucht might attach his windmill to a truck, substituting for the screw an axle and gearing to the wheels; he would then see whether the apparatus had power to drive itself up in the face of the wind upon a plank or rails. Even this, however, would give conditions much more favorable than those of a ship, because with the wheels locked, as would be the case, at least (the sails acting as a brake), the wind would not be able to drive the truck backward except in a strong breeze, while a ship would have no such bite upon its supporting water, but would drift freely. Rig a windmill, the axle of which should be supported by a spring balance, which would measure the pressure of the wind when the sails were fixed, and also when free to revolve. Affix gearing which would raise a weight, and measure the wind pressure with varying weights and velocities. Such experiments, frequently repeated in steady winds, would soon show how much of the wind pressure could be converted into work available. With a vertically mounted windmill, the axis would have to be mounted on a bridle, or fitted with two balances to support it against the pressure.

Covering Steam Pipes.

A new method of covering steam pipes has been patented by Herr Weiss, civil engineer, which is coming rapidly into use in the mines in the district around Saarbrucken. It has proved very efficient, and is applied in the following manner. A coat of thin loam wash is first given to the pipes, which serves to increase the adhesion of the mass with which they are to be covered. The mass itself consists of equal parts of loam or clay, free from sand, and brick dust, with an addition of calves' hair. After being well mixed, it is applied to the pipes in a hot state. For better securing this coating, wood splints, 0.26 metre long, 22 millimetres thick, and 13 millimetres broad, are laid along the whole length of the pipes, and fastened by thin iron wire. After again applying the loam to the dried mass till all the cracks have disappeared, the pipes receive another coating of the composition, until they feel quite cool, which will be the case after it has been laid on to the thickness of from 124 to 140 millimetres. A coat of cement and linseed oil is finally given. The above method answers at present all requirements, the covering being perfectly air-tight and free from cracks. The mass is not hygroscopic, a property fitting it especially for pipes in the open air. The cost of the covering per foot of 8-in. pipe, is 12c., the expense of the old method amounting to nearly 16c.

Atmospheric Telegraph at Paris.

The name, Parisian Atmospheric Telegraph Company, is somewhat a misnomer. By telegraphing we understand the transmission over wires of messages by means of electrical signals. The system we are about to describe briefly is exactly similar to that which has been in successful operation for some time in London, for the distribution of mails to and from the different post offices. It consists in the propulsion through tubes of small carriages containing within them messages, etc. These tubes are of small dimensions, and laid down beside the gas and water-pipes. The system is composed of sixteen tubes, each of which is about 1,300 yards in length. These sixteen tubes, placed end to end, are separated by sixteen telegraph offices, the distance between each of which is traversed in rather less than a minute. The carriages might be sent more rapidly, but the speed mentioned is quite sufficient. The oldest part of the work was constructed during the time of the Empire, and consists of six tubes forming an almost regular hexagon. These tubes are traversed every fifteen minutes by *trains* of small carriages or boxes which move with the sun.

On this central system are grafted two branch systems and three single lines. Counting stoppages, the trains travel at the rate of more than a mile in five minutes. It is said that, when properly delivered, a message should not take longer than when sent in a cab by a special messenger. The *trains* are propelled by atmospheric pressure, which is obtained by means of an ordinary air-pump piston. The despatch and reception of trains is communicated from station to station by electric telegraph signals. The simplicity of the operations is manifested by the fact that three men suffice for the work of the central station, one of whom is also employed occasionally as messenger. The principal work of the system, as may be gathered from its name, is the distribution through Paris of telegrams from the provinces.—*Canadian Patent Office Record.*

Scientific Progress.

Increasing Temperature of the Earth.

When Alexander von Humboldt wrote the "Cosmos," the deepest known bore-hole was that of Oeynhausen, near Minden, in Westphalia, reaching to a depth of 2,220 ft. Rhenish, or 2,284 ft. English. Since October, 1872, however, the great bore-hole, which was sunk through rock-salt at the village of Sperenberg, near Berlin, has reached the considerable depth of 4,052 ft. Rhenish, or 4,160 feet English, undoubtedly the greatest depth which has ever yet been attained. This bore-hole was used for making observations on the temperature of the earth's crust, and Oberbergrath Dunker, of Halle, has recently published a pamphlet on the results obtained. For these observations Walferdin's ordinary maximum thermometer could not be used, but the so-called gas-thermometer of Magnus was substituted for it. The temperature obtained was at

Rhenish	English	Fahr.
ft.	ft.	deg.
100	102.9	52.7
1000	1029	73.8
2000	2058	91.4
3000	3087	109.4
4042	4159	118.6

With respect to these results the author remarks, that in this bore-hole, which is filled with water, regard must be taken to the circulation of the latter, as the warmer water at the bottom, having the least specific gravity, has a tendency to rise, and the upper strata an opposite tendency to sink to the bottom, consequently, when measuring temperatures in very deep bore-holes, the index of the thermometer must show somewhat too high near the surface, and somewhat too low at the bottom for the actual temperature of the rock.—*Eng. and Ming. Jour.*

The Oxyhydrogen Light.—M. LeBlanc, gas tester to the city of Paris, considers it proved that the manufacture of oxygen on the large scale is quite practicable. The proportion of nitrogen present was not found less than from 13 to 14 per cent., and, from a variety of causes, a higher standard of purity can scarcely be expected. There has been no opportunity of verifying the inventor's statement concerning the length of time—a year at least—that the manganate of soda will serve without revivification. To keep the reagents in a serviceable state in the retorts, the air admitted must be previously deprived of its carbonic acid. His conclusion is that the Company Tessie du Mothay has not been able to show any commercial economy, and that, for an equal amount of light, the system is more expensive than lighting with ordinary coal-gas. There may be certain special cases where this light, possibly too brilliant for ordinary use, will be advantageous. The hygienic employment of oxygen in hospitals is neither practically useful nor preferable to good ventilation. In certain cases, an excess of oxygen in the air might have an unfavorable influence. As regards heating and metallurgical operations, if we except the extraction and fusion of platinum by Ste.-Claire Deville's method, it is by no means demonstrated that this gas would be preferable to atmospheric air.

Lead.—G. Brügel remarks that the more free from impurities lead is, the more readily does it stain the hands, linen, &c., when handled. Impure lead is almost always much whiter, and softer than that which is less adulterated. The impurities with which lead is most commonly contaminated and which unfit it for many technical purposes, more particularly that of white lead making, are sulphur, iron, tin, antimony and copper. Pure lead melts at 330° to 335° Cent., and in closed vessels is volatile at a white heat. At a little below its melting point it is brittle.

Artificial Cryolite.—Crude or, better, distilled hydrofluoric acid is taken containing 5 per cent. of anhydrous acid and half saturated with pure alumina. A solution of sodium chloride is then added until the mixture contains three equivalents of soda for one of alumina. The precipitate is artificial cryolite.

Carbonic Acid in the Air.

Sir Walter Trevelyan, in a communication recently addressed to the *Gardener's Chronicle*, starts a curious and ingenious theory on the advantage of a small per centage of carbonic acid in the air. The sedative nature of this gas is well known, and with most animals in a state of nature, sleep comes on at the time when plants commence to develop carbonic acid, that is, at sunset—and it relaxes its hold about sunrise, when plants begin to exhale oxygen. Further, when men and animals compose themselves to sleep, they not only do so in the position which gives the greatest relaxation to the muscles, but they "place the head so as to favor the accumulation of that gas about it, and consequently its inhalation. The head of a man, when at rest, generally lies low, on a soft and depressed pillow, those of most quadrupeds couched between their paws, and those of birds nestled among the feathers of their back or wings," so that in all these cases, owing to the low and confined position of the mouth and nostrils, much of the air must be inhaled again and again, and become gradually mixed with a larger proportion of carbonic acid. He also adduces the fact that the carnivora, who are nocturnal in their habits, retire during the day to deep and narrow caverns, in which the air becoming vitiated by their respiration, tends to promote sleep. The obvious objection to this theory is, that the carbonic acid becomes rapidly diffused, so that the air in every part of the room would probably be found to be sensibly of the same composition.

A Chemical Experiment.—To prove that the inner, dark portion of an illuminating flame contains combustible gases, the general practice with experimenters is to insert into that part of the flame a glass tube, so inclined that a portion of these gases shall rise into it, and thereupon igniting them at the farther extremity of the tube, or leading the contents of the tube by an aspirator into a convenient vessel, when its combustibility can then be directly tested. Mr. Henman has communicated to the German Chemical Society another method, and a simpler one, of accomplishing the result, which seems worthy of notice.

He recommends taking advantage of the well-known fact that a mixture of about four parts of chlorate of potassa and one part of strontium nitrate, heated to fusion, will burn with a very intense flame in hydrogen or illuminating gas, when once the ignition of the oxygen liberated from this mixture is effected by contact with a flame.

To perform this very pretty experiment, the author states that it is only necessary to fuse a small quantity of the mixture in question in a little spoon at the apex of a luminous gas flame, and then to lower it into the dark portion, when a brilliant combustion will immediately ensue; while, when removed to the luminous portion of the flame, or taken altogether out of it, is at once extinguished.—*Jour. of the Franklin Inst.*

A New Poison.—There has lately been discovered a poison called *inea*, which is said to be more subtle than digitaline. It is obtained by pressure from the seeds of *Strophanthus hispidus*, an apocynaceous plant, found in Gaboon, and from experiments made with samples of it, taken from arrows upon which the natives placed it, it appears that it acts more powerfully than digitaline or antiarine, and quickly paralyzes the heart. Three milligrams kill a frog, a sparrow or a dog, though the resistance of several animals varies. A snail, for instance, requires five milligrams; a mouse has withstood three milligrams of the extract (obtained by macerating the seeds in alcohol), while the latter dose kills a dog nearly a thousand times heavier than a mouse. The heart comes to a complete standstill after a few irregular efforts.

Soluble Glass.—The employment of soluble glass in the chemical and industrial arts is constantly increasing, and its value is now fully established. Recently a cement of great hardness and various applicability has been produced by mixing different bases with this singular substance. It is found that, combined with fine chalk and thoroughly stirred, it will produce a hard cement in the course of six or eight hours. With fine sulphide of antimony, a black mass is produced which can be polished with agate, and possess a superb metalic lustre. Fine iron dust gives a gray black cement. Zinc dust produces a gray mass exceedingly hard, with a brilliant metallic lustre, so that broken or defective zinc castings can be mended and restored.

Potash in Plants.—A correspondent of the *Country Gentleman* gives the following table, showing the amount of potash contained in 1,000 lbs. of ashes made by burning different kinds of wood: pine, ½lb.; poplar, ¾lb.; beech, 1¼lb.; maple, 4lb.; wheat-straw, 4lb.; corn-stalks, 17 lb.; oak-leaves, 24lb.; stems of potatoes, 55lb.; wormwood, 72lb.; sunflower stalks, 19lb.; oak, 2¼lb.; beach bark, 6lb. The remaining portion of the ash, consisting of carbonate and prosphate of lime, iron, manganese, alumina, and silica, is an excellent fertiliser.

Chloral Hydrate as an Antiseptic.—Jacobsen finds that chloral hydrate has antiseptic properties, ¼ of one per cent. added to a concentrated solution of albumen (equal parts dry albumen and water) preventing decomposition for a long time.

Weekly Variations in Stocks.

GIGANTIC MINING ENTERPRISE.—The Nevada *Transcript* gives a detailed description of the work in the North Bloomfield Gravel Mining Company, closing as follows: The size of the tunnel from the lower end or mouth to shaft No. 6, is 6½ feet high hy 6 feet wide; from that point to shaft No 8, it is 8x8 feet. It is now being worked from the foot of each shaft, hoth ways, making from 95 to 108 feet per week. This work is heing done hy contract, each different heading heing a separate contract, employing from 150 to 175 men, who are making from $3.50 to $6 per day of eight hours. Up to this time the lower end or mouth has also heen run hy hand and hy contract, hnt the company is now msking preparations to put in the Diamoud Drill Machine, which was very successfully worked in the tunnel of the Union Gravel Mining Company, situated at Columbia Hill, in this county, and when that is fairly started, the compauy expect to increase the rate to 115 feet per week. Some parts of the tunnel are very wet, and the amount of water raised hy the pumps at the varions shafts is ahont 490,000 gallons per 24 hours. The entire length of the tunnel will he 7,874 feet, of which 2,515 feet is completed. Work was commenced in April, 1872, and it is expected to he completed in fifteen months more, at which time tbe estimated total cost will he ahout half a million of dollars. To he added to this is the layiug of the pipes conducting the water to each shaft, the erection of the machinery and the houses over the track leading from them.

SUPPLEMENT.—With this nnmber of the PRESS will be found a supplement containing the advertisement of the Mutual Relief Association of Petaluma.

Our Weekly Stock Review.

THURSDAY EVE., Oct. 16th, 1873.

There has not heen much business done in Mining Stocks dnring the past week, and prices continue generally low. The dividends declared for the month by mining companies are generally lower than they were last month, hnt that makes very little difference as far as the prices of the stocks are concerned. The low state of water in the Carson river retards hnllion production, and ore still continnes to collect on the various dumps of the Comstock mines. The weather sharps unite in promising a wet season, and, if their predictions are verified, the hullion product of the placers of this State will he much increased next season. The more water the more gold is a certainty in California.

Letters from the varions mine Superintendents are more than usnally enconraging of late, and everyone is sangnine that a prosperous winter is coming.

The Belcher letter of the 11th says that the varions ore-hreasts throughout the mine look splendidly, and give promise of a long-continued yield of fine ore. In relation to the dispute hetween this mine and the Crown Point, the Virginia *Enterprise* says: "The snrvey of the line hetween the Crown Point and Belcher mines, hy J. E. James, agrees very nearly with the survey made some time since hy Mr. Marlette. It shows that on the 1300-foot level the Belcher Company have worked over npon Crown Point ground a distance of nearly twenty feet. At the 900-foot level they were exactly on the line, hut in going down gradually deviated from the perpendicular, until at the 1300-foot level they were, as we have ssid, nearly twenty feet into Crown Point ground. We understand that reclamation will he made on the Belcher Company for ahout $1,000,000. The ore at this point in the two mines is very rich, and estimates that have been made in regard to the value of the ore taken from the Crown Point gronnd show that it would amonnt to ahout $1,000,000."

The Eureka (Grass Vslley) mine pays a dividend of $40,000 this month. The last clean-np was 1,050 ounces of amalgam.

On the 15th inst. the Board of Brokers held only one session, on account of the judicial election, which took place on that day. A general weakening of prices was manifested, possihly on account of the news of the possibility of further money troubles in the East.

The following mining companies have levied assessments thus far this month: Hale & Norcross, Washoe, $5; Ophir, Waehoe, $5: Lane & Kurtz, Carihoo, British Columhia, $1; State of Maine, Cal., 5 cents; Red Jacket, Idaho, $1; Virginia Con. M. Co., Cal., 5 cents; Commercial Coal M. Co., Santa Cruz Co., Cal., 25 cents; Lady Franklin, 50 cents; Revenue Consolidated, Arizona, 25 cents; Ohio Consolidated, Calaveras Co., Cal., 15 cents; Julia, Washoe, $1; Leo, Washoe, 10 cents; Globe, Gold Hill, 50 cents; Ida Ellmore, Idaho, $3; New York Consolidated, Gold Hill, 25 cents; Phœnix, Eureka, Nev., 50 cents; El Dorado Sonth Con., Belmont, Nev., $1; Daney, Washoe, 50 cents; Emerald Hill, Utah, 25 cents; Washington & Creole, Ely District, $1; Lady Esten Tunnel, Utah, 10 cents; Equitable Tunnel, Utah, 10 cents.

The dividends paid this month by mining companies are as follows:

NAME.	PER SHARE.	AMOUNT.	PAYABLE.
Belcher	$3	$312,000	Oct. 10.
Black Bear Quartz	30c.	9,000	Oct. 17.
Derby	50c.	———	Oct. 22.
Crown Point	$3	$300,000	Oct. 10.
Eureka, Grass Valley	$2	40,000	Oct. 7.
K. K. Consolidated	25c.	12,500	Oct. 15.

Last month the Minnesota paid a dividend of $1.50 per share, aggregating $30,000, and the Raymond & Ely paid its first dividend since February last, amounting to $3 per share, or $90,000. Belcher paid $5 per share or $520,000, and Crown Point $4 per share or $400,000. The Eureka (Grass Valley) psid in Septemher only $1 per share, or $20,000, and the Golden Chariot paid $3 per share or $30,000. The dividend of the Derby Mining Company, located in Utah, is the first ever paid hy that company. The Black Bear has not paid one since last July until this month.

MORE MINING DISCOVERIES.—Visalia, October 7: There is considerahle excitement in town to-day over the discovery of new mines in King District, about three miles east of the first discoveries. Specimens just hrought to town show free gold in considerahle qnantities. Specimens of silver ore from the same district srs said hy mining experts to he similar in character to the richest specimens of Lone Pine rock. The discoveries are at the head of the Kaweah river, fifty miles east of Visalia, and directly opposite Lone Pine, which is on the other side of the mountains. Au assay of the first rock showed $87 in silver and a large percentage of lead; but the new discoveries are believed to be much richer. The ledge is said to be fifteen to twenty feet wide, and two or three miles loug, in sight. Specimens will he sent to San Francisco to-night for assay. Many hnsiness men and all the hangers-on ahout town, have gone to the mines, and nothing is talked of on the street hut "feet."

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

THE BOSTWICK MINE.—Amador *Ledger*, Oct. 4: We paid a visit to the Bostwick mine, at Scottsville, about a mile and a half from Jackson, a few days ago, and were somewhat surprised to find that so much work had been done toward opening and prospecting the mine. The lead is quite extensive and can be easily traced for a long distance on either side of the mine, running from north-west to south-east. Mr. Bostwick had some of the rock assayed some time ago and it showed a prospect of $25 per ton in gold and $6 in silver.

CAVED ON.—A miner, whose name was unknown to our informant, was severely bruised and injured about the head and shoulders last Wednesday, while working a hydraulic claim, near the "Gate" by the caving in of a bank of dirt upon him.

MARIPOSA COUNTY.

HASLOE MINING COMPANY.—Mariposa *Gazette*, Oct. 10: A contract was let by the new Superintendent of this mine, Mr. Rob't Hannagan, some two months since, to sink 100 ft. on the vein. At the depth of 40 ft. they struck rich ore, which, it is reported, will pay from $50 to $100 per ton. Appearances indicate that this pay streak is likely to continue. Their new ten stamp mill is now in successful operation, and the first shipment of bullion has been made to the company's office in San Francisco. The result gives general satisfaction. As before remarked, this mine has been immensely rich, and it is very probable that its ancient status may be revived. It was formerly known as the Funk Hollow Mine, and was successfully worked some years ago by H. G. Coward.

NEVADA COUNTY.

SLATE LEDGE MINE.—Grass Valley *Union*, Oct. 10: This mine (better known as Perrin's) is looking well at the present time. A party of miners have a contract there for taking out ore, and their contract is paying well. They are taking out rock which pays over $50 a ton. A crushing was had, the other day, of rock taken out by ten men in three weeks time, and the result was 99¼ ounces of gold of the value of about $1,600. The contractors are working below the work done by the company, and water troubles them. The rock, however, is proved to be rich.

MICHIGAN BLUFF.—River mining has been prosecuted with energy the present season, though with variable results. Owners of mines rely more on vigorous and systematic working and utilizing the great water power they possess for a reward for their toil and investments, than in the expectation of finding rich strikes and rich spots at every turn.

A majority of the claims are yielding a fair average—a few a good deal more. Farquaharson and Margiuni are working on the North Fork, above the junction, and are raking it out to the tune of from 5 to 25 ounces a day. Labor expenses per day, including wear of machinery and tools, about $16; leaving a nice margin for profit.

Ditch building is all the rage. The Iowa Hill canal, a new ditch from one of the forks of Shirt Tail Cañon leading to Yankee Jim's, and a large ditch, nearly completed, which taps the South Fork near its source, and traverses the ridge bordering the river to Mount Gregory, with a branch to Georgetown, are a few of the enterprises of that character carried on in and near this locality, which, when completed, will infuse new life into mining and other industries.

PLUMAS COUNTY.

SALE OF MINING PROPERTY.—Plumas *National*, Oct. 4th: Messrs. Heath and Dodds have recently purchased the splendid mining claims on Bear Creek, near Buck's Ranch, so long owned by Mr. Jno. Morrow. The former owner has worked the claims with a small head of water for many years, and always with good results. The new company propose to bring in the waters of Mill Creek, in a canal about nine miles in length, which will cost heavily, but as the pay ground is almost limitless the investment is a safe one.

STRUCK IT.—We have been shown some specimens from a ledge recently discovered by Mr. W. W. Kellogg, of Cherokee, which show splendidly in free gold, and look very much as though "Billy" had made a valuable hit. We hope it will prove as good as it looks.

PLACER COUNTY.

COAL MINE IN PLACER.—Placer *Herald*, Oct. 11: We learn from a friend that a bed of coal has been discovered at Lincoln, in this county, which promises to be of great importance, not alone to that section, but to the whole country. The same material was struck as early as 1862, while boring a well, but it attracted no attention, as no one seemed to suspect the existence of coal in that part of the country. Since that time it has been struck upon by well borers, but until recently the real character of the mineral thus unsuspiciously brought to light was not considered. To be sure, the presence of this, what was thought peculiar mineral, was occasionally talked of, and it so much resembling stone coal, some parties were at last induced, through curiosity, to try it. They were agreeably surprised to find that it possessed, in many respects at least, the properties of stone coal, but the crumbs which they submitted to the test being those brought up by a small auger, were too small to afford a perfectly satisfactory test. But the result created an interest, sufficient to induce Col. Wilson, a capitalist and property owner in Lincoln, to begin a thorough investigation.

SIERRA COUNTY.

OTHER CLAIMS.—Claims here do not seem to be doing very much. The Union has dismissed their Chinamen, and work but one shift at present. The Highland Mary, at Wahoo, have just completed a house and blacksmith shop, and some think it will prove a very rich claim.

STANISLAUS COUNTY.

LAGUANGE.—Stanislaus *News*, Oct. 10: We understand that the Lagrange Mining and Canal Company have commenced to enlarge the Patricksville reservoir, near that place. The ditch is also to be continued some three miles down the foot-hills. A large force of men and teams are already at work, and the old town of Lagrange is assuming much of her former importance in our county.

TUOLUMNE COUNTY.

IRON ORE.—Tuolumne *Independent*, Oct. 11: A second shipment of iron ore arrived in Stockton, on Tuesday, from the mine, at Jamestown, consigned to Kruese & Enler, San Francisco, for transportation East, per Carrier Dove. The Stockton *Independent* says, "The ship named is, we understand, to take 100 tons of the ore; and 600 tons are to be sent forward immediately to be tested. A good judge of iron ore stated to us last evening that he is firm in the belief that much of the ore designated will produce as much as eighty per cent. of pure iron of good quality."

SOULSBY.—They are taking out good rock from the south shaft of the Soulsby mine.

COLUMBIA DITCH.—The water in the Columbia Ditch, for general mining purposes, gave out on Tuesday last. A week's rain would set the boys going again.

WASHING UP.—The miners supplied by the Columbia Ditch have been busy this week washing up. Most of the claims turned out well, and the season has been generally prosperous to these engaged in placer and hydraulic mining.

TULARE COUNTY.

THE NEW MINES.—Tulare *Times*, Oct. 11: Quite a number have returned from the new mines on the Kaweah, during the week. They bring the most favorable reports and exhibit some splendid specimens of ore. One party, of which Senator Fowler and others were members, show rock from a ledge which they located that discloses gold freely to the naked eye. The ledge is said to be about ten feet wide and crops out for more than a mile. Some fine specimens of silver ore were brought in from the Crahtree mine. There are quite a number of prospectors at the mines; but the extent of the country is so great and the ledges so numerous that during all next summer there will be plenty of chance for all new-comers to find mines. Owing to the altitude the season there is already, far advanced, and not much more exploring can be done this year. Next Spring we expect a high excitement over these new discoveries. We have little doubt that Prof. King is right when he pronounces the region in which these mines are situated to be one of the richest in minerals in the United States.

MORE MINING DISCOVERIES.—There is considerable excitement in town to-day over the discovery of new mines in King District, about three miles east of the first discoveries. Specimens just brought to town show free gold in considerable quantities. The ledge is said to be fifteen to twenty feet wide, and two or three miles long, in sight.

SUTTER COUNTY.

QUICKSILVER.—Marysville *Appeal*, Oct. 12: At the Empire Foundry may be seen two quicksilver retorts, which are now being finished for the Caswell mine, near Simmons' Sulphur Springs, in the Coast Range. The cinnabar ledges being opened and prospected in that section promise to be extensive, and before the lapse of many years quicksilver will be produced in quantities equal to those now furnished by the New Almaden mines. The Colusa coast range cinnabar is very rich, and the percentage of quicksilver per pound is quite equal if not superior to any mined in the State. The development of the mines will prove of great advantage to all kinds of business in this part of the State. The Chapin Company is about to commence the erection of works on their mine, and others will be located.

Nevada.

ELY DISTRICT.

MEADOW VALLEY.—Pioche *Record*, Oct. 12: Incline No. 3 has been sunk 105 ft. below the ninth station. There has been no change in the rock. The east drift at the 520-ft. level is in 200 ft., the face being quartzite. The east drift from the 630-ft. station is in 638 ft. The east drift from the 750-ft. station is in 360 ft., the face showing a strong vein of quartzite, carrying metal. From incline No. 7 the east drift at the 4th level is in 40 ft. The drift at the 8th is 470 ft. in length.

PIOCHE.—During the present month, 92 tons of ore have been shipped to the Amador Mill. Assays average $116.63 to the ton. In the new shaft, a contract was finished day before yesterday, making the hole 314 ft. deep.

CHIEF OF THE HILL.—A progress of 9 ft. in the shaft, and 10 ft. in the west drift has been made since last weeks report.

SILVER PEAK.—The incline is 326 ft. long. The ledge at the bottom is 5 ft. in width, and contains some ore of an excellent quality. By a cross-cut in the west drift a body of fine chloride ore has been developed.

LOUISE.—There is considerable improvement at the 200 ft. level. The workmen are there raising on the ledge, which is now nearly 1 ft. wide, and of very good ore.

SPRING MOUNT.—The workmen have got out of shale into quartzite, the most favorable indication since the shaft was started.

PIOCHE WEST EXTENSION.—The sinking of the shaft is being continued. Station timbers are being put in at a depth of 600 ft.

BOWERY.—The machinery has been stopped for repairs. The work is still going on underground.

POUTLAND.—The sinking continues. Ten feet more will make the shaft 300 ft. in depth. The drifting will then begin.

SPRING MOUNTAIN TUNNEL.—The work of sinking from the tunnel continues without change. The usual force of men is employed.

ALPS.—The winzes have a favorable appearance, and the main drift is progressing satisfactorily.

CHIEF EAST EXTENSION.—Work is progressing as usual, and some ore is being taken out daily.

PEAVINE.—The shaft is being sunk as fast as could be desired.

CHAPMAN.—There is no change to note since our last report.

WASHINGTON AND CREOLE.—The same work is being done as reported last week.

HUHN AND HUNT.—Improvement throughout the mine continues.

SINKING.—In the Pioche, Phenix, Ivanhoe, Raymond & Ely, Carolina and South Side Mines, the work being done is the sinking of the several shafts.

WASHOE DISTRICT.

BELCHER.—Gold Hill *News*, Oct. 11: Daily yield 400 tons of ore. The quantity of ore extracted can be greatly increased whenever mills can be obtained to crush it. The main incline is down 112 ft. below the 1,300 ft. level, the sinking making excellent progress. The main drift north from the incline on the 1,300 ft. level, to connect with the main south drift from the Crown Point on the same level, is making excellent progress. The main drift south from the Crown Point is in 395 ft., the face in good ore. The winze from 1,200-ft. level is still in fine ore. Sinking the winze from the 1,300-ft. level is making fine progress, the ore in the bottom showing a steady improvement. The ore breasts throughout the mine are both looking and yielding finely. The bulkhead between the Crown Point mine and the Yellow Jacket will shortly be removed, when extracting ore from the 1,300-ft. level will be resumed.

CROWN POINT.—About 380 tons of ore are being extracted daily. It is taken from the 1,000, 1,200 and 1,300-ft. levels. The ore breasts still look well, and are yielding the usual amount of ore, similar in quality to that already taken out. The winzes are being pushed vigorously ahead, and have already attained a vertical depth of 55 ft. The middle winze shows ore of a much better quality than the north one. The main drift from the 1,400-ft. station is in a distance of 250 ft., and is being rapidly driven forward toward the Belcher line. No work has been done on the 1,500-ft. level with the exception of driving a drift northward to meet a drift running southward from the Yellow Jacket mine. Water, scalding hot, flows so freely from the main drift on the 1,500-ft. station that it has been considered unsafe to proceed with the drift, as the pump is now worked to its fullest capacity.

CONSOLIDATED VIRGINIA.—Enlarging the main shaft will be completed, and hoisting ore through it will be commenced in about four days more. There are now sixty tons of high grade ore being extracted daily through the main drift on the 1,167-ft. level of the Gould & Curry shaft, which will be increased to 260 tons per day as soon as the company can resume hoisting through their own shaft. The ore breasts are now opened out 40 ft. in width, and are being gradually extended in width as the work of extraction progresses. The body of ore opened is improving daily in quality, and there is no longer a doubt as to the richness and value of the deposit.

BALTIMORE CONSOLIDATED.—The main west drift at the second station, during the week, cut through a vein of solid ore, lying directly against the east wall of the ledge, five feet in thickness, which assays from $20 to $92 per ton. The drift is still continued to the westward, the face being in very promising vein matter, and excellent indications of striking a continuation of the ore. The west drift at the third station shows a continued and steady improvement. There is no change to report of the first station.

JUSTICE.—The north drift from the up rise in the north drift on the 800-ft. level, has developed some rich ore, which bids fair to develop into a fine and extensive body. The east cross cut from the 300-ft. level is being pushed rapidly ahead to make connection with the Waller Defeat works. Both the north and south drifts at the first station of the Waller Defeat shaft are in good ore.

AMERICAN FLAT.—The first cross-cut from the main south drift at the third station has penetrated a splendid body of ore the distance of ten ft. the full face of the drift still being in fine ore. The second cross-cut from the same drift, 50 ft. south of the first, this morning cut the face of the ledge, showing splendid ore, the extent of which is not yet known.

DANEY.—The shaft is down 193 ft., the sinking making excellent progress, the rock in the bottom blasting and working finely. Some little water is encountered in sinking, but not enough to in the least impede the work. The new machinery is all working splendidly, and there seems to be nothing now to interrupt the steady development of the mine.

SAVAGE.—Sinking the main incline for the 1,900-ft. level is making fine progress, the rock in the bottom working and blasting well. The east cross-cut on the 1,600-ft. level is still pushed steadily ahead, with the face in clay, quartz and porphyry. It is the intention to continue this drift until positive assurances are found that the east wall has been reached.

TYLER.—The shaft is down 198 feet, the sinking making good progress, although the flow of water somewhat impedes the work. Some stringers of quartz of a very promising nature have been cut during the week, indicating a near approach to the main ledge.

DAYTON.—Drifting both north and south on the ledge, at the first station, is making good progress, the face of both drifts being in ore.

CHOLLAR-POTOSI.—Daily yield 100 tons of ore, the assay value of which is $33 per ton. In the Blue Wing section the ore breasts are not yet yielding quite so well as at our last report. In the Potosi section the ore shows a considerable improvement in quality. Bullion receipts for September, $43,636.70.

IMPERIAL.—Sinking the main incline is making fair headway, though the rock in the bottom blasts quite hard. The quartz in the face of the south drift on the 1,700-ft. level has shown considerable improvement during the week. The cross-cut west on the 1,700 level is making good progress.

SIERRA NEVADA.—There is but little change in this mine to report. The ore breasts are all looking and yielding finely. The mill is kept steadily running, crushing ore from the mine. Daily yield 60 tons of ore. Shipped during the week, $11,123.08.

FRANKLIN.—The recent good ore developments and indications in the Baltimore Consolidated and American Flat mines, being close to the Franklin, and doubtless extending into it, justly cause the owners of the mine to feel pretty good over their excellent prospects.

SILVER HILL.—The ore breasts on the first level, both north and south, continue to improve in appearance and quality of the ore extracted. The north winze is making fair progress, the entire bottom in fine milling ore. The ore body on the lower level of the mine continues to improve in both the main north drift and west cross-cut.

SUCCOR.—The main east drift, at the second station of the new shaft in the cañon, is still driven ahead with the expectation of tapping the ledge in a very short time.

HALE & NORCROSS.—Daily yield, 60 tons of ore. Sinking the incline is making steady progress, though the rock in the bottom continues to blast tough and hard. The prospecting drifts at the tenth and eleventh stations have been discontinued.

EMPIRE.—The face of the east cross-cut on the 1,700-ft. level shows considerable improvement since our last report. The material in the face is much softer, with some quartz and excellent indications of an ore vein ahead, proving conclusively that the east wall of the ledge has not yet been reached.

NEW YORK CONSOLIDATED.—Sinking the shaft is making good progress, although the work is somewhat impeded by the heavy flow of water. Some stringers of quartz of a promising character have been cut during the week.

WOODVILLE.—Sinking the shaft is making good headway, the rock in the bottom working finely. Extracting ore from the old works continues, the ore-breasts not only holding out, but steadily improving in quality and quantity.

GOULD & CURRY.—Drifting and prospecting the different levels throughout the mine is progressing as usual. Bullion shipped during the week, $15,000.

ARIZONA, UTAH AND GLOBE.—The main west drift at the 400-foot station is still driven ahead, with strong indications of a near approach to the main ledge. Sinking the incline is making good progress.

BUCKEYE.—There is little or no change in either the quantity or quality of the ore produced since our last report. All the ore-producing sections are looking and yielding well. The Hope mill is kept steadily running crushing ore from the mine.

CALEDONIA.—The work of enlarging the main shaft by the addition of a third compartment is making good progress. The ore breast, both north and south, on the second level, is yielding finely. Bullion shipped during the week, $7,177.73.

UTAH.—Sinking the shaft is making but moderate progress, the heavy flow of water from the bottom considerably impeding the work. The entire bottom of the shaft is in fine appearing quartz, with occasional spots of excellent ore.

OVERMAN.—Sinking the shaft is making good progress. It is now down to the 1,200 foot level. Drifting and prospecting on the 1,000 foot level continues, with very favorable indications of yet developing a body of good ore.

JULIA.—Driving the main southwest drift at the 900-foot level is making excellent progress, with prospects of soon reaching the ledge.

OPHIR.—Prospecting the different levels progresses as usual, with no change of material value to report, except a slight improvement in the main south drift on the 1,300 foot level.

Hydraulic Mining in Calaveras County.

No hranch of producing industry in this county has so rapidly increased in importance, during the two or three past years, as hydraulic mining. Within tbe period of time mentioned the system of hydraulicing formerly in vogue has heen revolutionized, and results reached that have given vigorous vitality to that species of mining. It is an absolute fact that deposits of gravel that with the appliances and method of hydraulicing pursued five years ago would scarcely pay "water money," are to-day yielding their owners bandsome profits for working. Ridges, in some instauces miles in extent, tbat a few years since were miued as long as operations could be made profitable, under the old order of things, and theu ahandoned, have since heen relocated and hy the present intelligent system of working are yielding even larger returns tban when in the hands of their original owners. But this is not the only gratifying circumstance connected with the great revival in hydraulic mining. The success achieved in re-working ahandoned ground has stimulated research and led to the discovery of new fields. We do not hazard an opinion in stating that there are douhle the numher of hydraulic mines now heing actively worked in this county than at any former period in its history, while the aggregate yield is proportionately much greater. Rapid as has heeu the progress made in thie hranch of mining during the past three years, evidences of increased activity iu the future are everywhere apparent. From different portions of the county we are constantly hearing of the inception of fresh enterprises, aud there is no question hut that with the advent of rain the "heaviest run" ever made upon the gravel hanks of Calaveras will he inaugurated. Without exaggeration there is hut one county in tbe State—Nevada—that now outranks Calaveras as a gravel mining section, and we honestly believe that hefore two yeare have elapsed we shall not he compelled to make even that exception.

The impetus recently given to hydraulic mining in this county is almost wholly due to the radical change in tbe manner of conducting operations. Formerly the great mistake was made of endeavoriug to use ae little water as poesihle. Now that element is subetituted for manual lahor in every manner practicahle. Five years ago fifty inches of water wae considered an unusually large quantity for a company to purchase. It was conducted to the claim through a emall canvas hose, with neceeearily little pressure, and precipitated against the hank from an inch nozzle. The etream had no more effect upon tbe gravel than would have heen produced by the discharge of a six-inch syringe. Miners were forced to "coyote" under the hank and "cave it down" to get gravel to wash—a elow, laborious and expensive method of procedure. The sluices attached to these primitive "hydraulics" were never more than twelve inches wide, or high, and yet their capacity was ample for the requirements of mining as then conducted. Tbat whole system of operatious has heen revolutionized. At present three huudred inches of water is the minimum employed iu any claim that aspires to the diguity of a hydraulic. Iron has taken the place of canvas for hose, and the greater the pressure to be ohtained the hetter. Patent nozzles direct the streame that cut down the hank like grass hefore the scythe, and the mingled gravel and water find passage from the mine through a three-foot flume. Really, more dirt is put through the sluices of a modern hydraulic in a week than was formerly washed during an entire season. And yet the cost of running oue of the mammoth hydraulice of to-day is but a trifle, if any, more than the expenee of conducting one of the piddling coucerns that disgraced the name ten years ago. Water works cheaper than bands, and the employmeut of that element, to the almoet entire seclusion of manual lahor, is the princi al reasou why it costs no more to wash a ton of gravel now than it formerly did to move a single pound.

Hydraulic mining in this county, notwithstanding the progrese made during tbe past two years, is yet in its infancy. A heginning has scarcely heen made. Two-tbirds of the ahandoned ground, from one end of the county to the other, will pay for re-working, aud new minee are coustauly being discovered and opened. As an illustration we will cite one instance: Near Murphys in this county a gravel mine, one hundred and sixty acres in extent, has lately been located and patented. Beyond a little superficial prospecting no work has been done upon it, and yet a tenth interest in tho ground wae sold for $10,000 the other day. Some curious individual hae made an estimate of the probahle yield of the entire mine, basing his calculatious upon the "prospects" ohtaincd. The result of his figuring is tbat tbe whole one hundred and sixty acres will yield an average of ninety cents per square yard. When the rapid progress made dnring the past few years, the steady developmeut of the present and the hrightening prospecte of the future are taken into consideration, who can set a limit to the immensity of the hydraulic mining interests of Calaveras a dec..de henco ?—*Calaveras Chronicle.*

Grains of Science.

Cruel Feet.

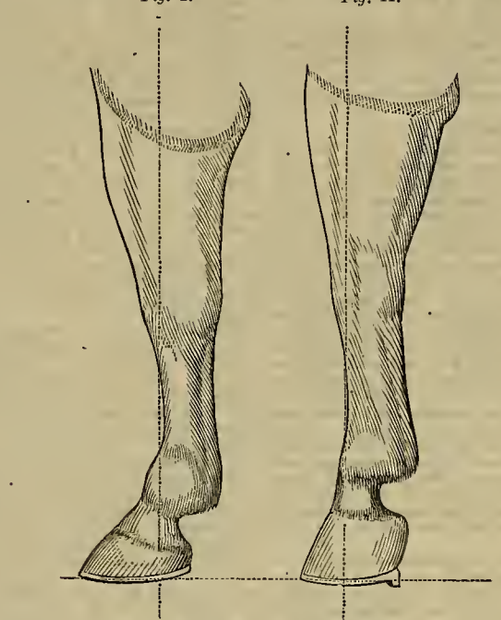
Did you ever notice the feet of the work-horses of San Francisco? Look at those faithful aud almost disabled brutes attached to hacks, street-cars and drays, and you will find uearly all of those which have worn shoes for six, eight and ten years, have growu high on stilts. Tbey have gradually lost the heel of the foot to stand npon, and are forced to tread upon the toe and middle of the foot. The heel proper is in the air.

Nature furnishes the foot of the colt with hoth a toe and heel, for a special object. Tbe philosophy of pedestrian locomotion determines that object, and explains the reason of it. The heel is the chief plantar organ to support tbe superimposed weight of the body; the toe is dutiful in propulsion. When the unthinking mechanic hy repeated hurtful shoeing, takes away one of these, and misplaces the position of the other, the foot assumes the character of a dull stump as seen in Fig. 2. The auimal's ahility to travel is then so impaired, that his motions thereat make one think of the motions of a Chinawoman whose shoes touch the ground in the middle of the foot. Horses with such feet are almost fated to stumhle, especially when going down grade. Feeling insecure on their feet they become reluctant steppers.

You will notice how the unwise mechanic agravates the evil of an over-grown heel hy giving to the shoe more thicknese at that point than at the toe. Fig. 2. outliues one of that kind. To develop such deformed feet is a cruelty to the nohle animal.

Fig. 1. depicts the natural foot of a colt or a young mule. The margin of the hair at the heel reaches to within a half or three-fourths of an inch of the floor. The vertical linee show how the natural heel sustains the weight of the animal in the one case, and how the toe and middle of the foot are made to sustain that weight in the other. The loss of one joint from Mr. Weeton'e great toe, would have prevented his celehrity as a walkist.

Fig. I. *Fig. II.*



NATURAL AND UNNATURAL.

In mercy to our poor uncomplaining servants, let not nature's beautiful patterns he longer thoughtlessly perverted.

As a *foot-note*, I cannot forhear telling an incident touching our suhject, as a seemingly honeet stranger recently told it to me. In Sacramento this stranger in former years, had purchaeed a large, well made dray horse for a paltry sum of money, hecause, as was supposed, the animal had out-grown his usefulness. There was no perceptihle defect about him except that he seemed mounted on high feet as if they were pedestals on which the innocent creature hohbled about. They measured seven inches from the hair line to the ground. With a carpenter's hand eaw, he cut off *four inches of the hoof*, which lowered him to a natural footing, raised him in value, and restored his large ahility to work. A. S. Hudson, M. D.

Seeds of Sugar Cane:—A. Cossa has heen making scientific investigation into the cause of the deterioration of the sugar-cane hy hyhridization. His attention was first called to it hy the fact that ahout half the canes on a Piedmontese eugar plantation yielded no sugar. On examination, it appeared that theee canee sprang from a different kind of seed which wae mixed with the other, and which was heavier, reddish in color, and germinated more easily, thongh hoth varietiee came from successive reproductions of the same plante. He helieves the sugar heet to he more reliahle than the cane.

The Sutro Tunnel.

Interesting Facts and Figures.

This great work is now employing ahout 240 men, and the tunnel is pushing along toward the Comstock lode at the rate of a little more than 100 feet per week. When shafts 2, 3 and 4 reach the tunnel level, which will he witbin a few months, a few additional miners will suffice to pnsh the great adit 300 per week, or nearly 50 feet per day. The total length of the tunnel from its mouth to where it will intersect the Curtis shaft of the Savage mine is, according to the engineers of the company, 20,178 feet, or nearly four miles, and according to the report of the United States engineers, 19,790 feet, or about tbree and three-quarter miles. Taking the company's measurement as tbe more accurate, and deducting 4,915 feet of tunnel run, up to yesterday, we find remaining 15,263 feet yet to be excavated. With all the shafts down to the tuuuel level, and drifting going on each way from the hottom of each shaft, as is the intention, tbis could he made in 306 days, or exactly ten months. We are hasing our estimate npon the progress made in the main header aud in the eaet and west drifts from shaft No. 1 (which reached the tunnel level eome time eince) during the present week, which we here give: Progress in main header of tunnel, 35 feet; in east drift from hottom of shaft No. 1, 33 feet, and in west drift from same, 33 feet; total, 101 feet.

The tunnel is 12 feet high, 13 feet wide at the top and 14 feet wide at the hottom, with a douhle row of strong timhere, plauked so as to form walls V-ehaped, passing through the center, hetweeu which is a footway ovorlying the caual, and on each side of tbis double wall is a railroad track. As hefore stated, the tunnel, running on an air line from its mouth, will strike tbe main or Curtis shaft of the Savage mine, at the 1,700 foot level, which is now being prospected. The franchise, surveys and estimates call for the tapping of the Comstock lode 1,898½ feet below Station A (established hy Clarence King in bis geological survey) of the Gould & Curry croppings, which point is, in round numhers, 200 feet above the surface at the Savage works. Shaft No. 1 is 5,198 feet from the tunnel; trom shaft oue to two is 4,150 feet; from two to three, 4,480 feet; from three to fcur, 4,150 feet, and from shaft four to the Curtis shaft on the Comstock, 2,450 feet. From the east drift from Shaft No. 1 to the main header of the tunnel is 218 feet. Shaft No. 1, completed to the tunuel level is 523 feet in depth; sbaft No. 2, which will be 1,041 feet in depth, is now down 623 feet, leaving 418 feet still to go; shaft No. 3, which will he 1,361 feet deep, is now 377 feet, leaving to go 984 feet; shaft No. 4, which will he 1,485 feet in depth, ie now down 510 feet, leaving 975 feet still to he excavated.

While it will he seen that only ahout one-fourth of the tunnel has been excavated, it is apparent that fully if not more than one-half of the expense of the entire work has already heen incurred, as one shaft has reached the tunnel level, giving two additional points from which to prosecute work on the main adit, and three other shafte are well advauced, hesides which, everything in the way of machinery that will he needed to completo the work is on the ground, and the company has a vast quantity of miscellaneoue supplies on hand. Adolph Sutro, the projector and general Superintendent of this stupendous enterprise, has not yet sailed from Europe, as was supposed, hut it is helieved that he will he here in the course of a few weeks, and we learn tbat he has met with marked success in negotiating for additional and ample capital to insure a vigorous prosecution of the work. During his protracted absence the affairs of the company have heen admirably administered and the work judiciously carried on by the efficient Assistant Superintendent, Mr. H. S. Safford.

From the foregoing facts and figures it will he seen that this great work is approacbing completion with far greater rapidity and certainty tban even our local readers bave generally heen led to helieve, and it now seems probahle that this great historical "hore" will he under our homes before we can realize tbe fact tbat it is under full headway. But it cannot he completed too soon for the welfare and safety of tbe thousands who are toiling in the burning depths of tbe mines, for as soon as the main adit reaches tbe Comstock, hranch tunnels will he pusbed botb ways along the lode to connect the various mines from the Ophir to the Overman, a distance of ahout 12,000 feet, or two miles and a quarter. Then we will have no more Yellow Jacket fires nor fire-damp, nor gas explosions, nor heart-rending scenes about tbe hoisting works, for the mines will he ventilated hy a volume of air that would sweep a man off his feet, and the miuers will have ample facilities for escape in case of fire.—*Virginia Chronicle, Oct.* 4.

Wooden Railways.

In the interest of cheap transportation for oree and fuel, an engineer writes: "The track is formed of heavy logs, hewed on the npper side to the width of eight inches, and on the inside at right angles, sufficiently deep to form a straight edge for tbe flange. These logs are huried so that the top, or rail surface, ie almost level with the road eurface, resting on etont sills at the ends and middle, to which they are eecured hy wedged tree-nails. The rails, therefore, are solidly hedded aud not liahle to warp or twist. Twenty feet would he a convenient length on curves, hut on straight lines longer pieces can he used, the ties heing ten feet apart. The grading of a sufficieut width on a eide hill with gentle slopes would cost ahout $200 per mile for a three feet gauge; hut, of course, the cost of graduation will vary greatly with the locality. Ravines and small watercourses would in general he crossed with rough trestles or timher cribs. Hewing the timber would cost ahout $200 per mile. In a wooded country, where timher can he ohtained along the line of the road, where no large hridges are required, and no rock to he excavated, the cost of such a wooden railroad ehould he covered by from $500 to $2,000 per mile, depending upon the amount of earthwork. The care proposed for such wooden railroads are simple frames placed on wheele, without springs, and covered with a floor of plank. The wheele are of wood, built up of pieces cut from two inch plank in the form of regular sectors, ahout eight inches at the wide end. Four thicknesses of plank will build a wheel with a tread of eight inches corresponding with the face of the rail. A cast iron huh is inserted in the center, through which an iron axle passes, and a cast iron flange is holted on the ineide. The timher should be of hard wood, well eeasoned, the sectors laid so as to hreak joints and well bolted. Diameter of wheels about 30 inches. Such cars, if uscd with horsee, would cost ahout $40 to $50, or about one-third the price of a farm wagon; they will carry three tons, and can he made hy any rough band who can use carpenters' tools. If designed for use with locomotives in trains, draw hare and springs must he used, and the cost per car increased.

Machine for Testing the Condition of Rails.—A Russian engineer named Sakhovsky, has invented an apparatus, a kind of differential gauge, of very simple construction, which is said to have heen found to work admirahly at the Moscow Terminus of the Nijni Railway, and ou several other lines. The apparatus consists of a heam, ahout five feet long, provided at one end with an articulated lever, on tbe shorter arm of which is a stud tbat preeses, by means of a sprfug, against the inner face of one of the rails, and at the other with a fixed stud; the heam is drawn along the rails hy a man by means of shafts, or it may he attached to a truck. As the gauge proceeds along the liue, the deviatious from the normal width hetween the raile is shown hy the longer arm of the lever, which moves against a dial-plate. The apparatns costs only eight rouhles, and its snperiority over the common gauge is striking, eepecially as regards the rapidity and continnity of the action. The directore of the Nijni and other liues have adopted the invention, whicb we helieve is pateuted. Such a gauge run along a line every morning migbt prevent many an accident.

Water for Seven-mile Canon.—A small flume has heen huilt from the terminus of the main flume of the Virginia and Gold Hill Water Company, at the northeud of town, to the mills at the head of Seven-mile Cañon. The small flume was completed and the water turned in two days ago. This gives to the mills in that locality an abundance of water not only for their hoilers, hut also for their hatteries and all other uses. There must now he qnite a stream flowing through the lower part of Six-mile Cañon, as a good deal of water is being constantly raised from the Utah mine and aleo from the new ehaft of the Sutro mine; hesides, the contrihution to Six-mile Cañon from this city is unusually large. This is fortnnate for the owners of water mills at the lower end of the cañon, as they can now keep tbeir works iu constant operation.—*Enterprise.*

Useful Information.

Greasing Buggies and Wagons.—Greasing buggies and wagons is of more importance than some imagino. Many a wheel is ruined by oiling ton plentifully. A well-made wheel will endure constant wear from ten to twenty years, if care is taken to use the right kind and proper amonnt of oil; hut if this matter is not attended tn, the wheel will be nsed np in five or six years, nr may be sooner. Lard should never he used on a wagon, for it will penetrate the hub and work its way aronnd the tondons of the spokes and spoil the wheel. Castor oil is a good material for nse on an iron axle; jnst oil enough should bo applied to a spindle to give it a light coating; this is better than more, for the snrplus pnt on will work ont at the ends and he forced by the shonlders and nnt into the hub around outside of the boxes. To oil the axletree, first wipo the spindles clean with a cloth wet with turpoutine, if it won't wipe without it. On a buggy or carriage, wipe and clean off the back and front ends of the hubs, and then apply a very small quantity nf castor oil, or more especially prepared lubricator near the shoulder'a point.

To clean paper-hangings, the following is a very good method: Cut into eight half-quarters a stale loaf of bread and with one of these pieces, after having blown off all the dust from tho psper to be cleaned, by means of a good pair of bellows, begin at the top of the room, holding the crust in the hand, and wipe lightly dnwnward with the crumb, about half a yard at each stroke, till the npper part of the hangings is completely cleaned all aronnd; then go ronnd again with the light sweeping stroke downward, always commencing each snccessive stroke a little higher than the upper stroke had extended, till the bottom be finished. This operation, if carefully performed, will frequently make old paper look almost equal to new. Great cantion must be used, not by any means to rub the paper hard, nor to attempt cleaning it across or horizontally. The dirty part of the bread must be each time cut away, and the pieces renewed as soon as at all necessary.

Preserving Charred Papers.—Mr. E. H. Hoskins, of Lowell, Mass., has suggested a very nseful and practical way of preserving and giving toughness and flexibility to charred paper, which has proved to be of much importance in the identification and copying of valuable documents, charred by conflagrations such as the recent Boston and Chicago calamities. We have seen specimens of charred papers and bank notes thns treated, that can be handled with impnnity. The printing upon the charred bank notes can be readily discerned. The preserving process consists, we believe, in ponring collodion npon the surface of the charred paper. The collodion forms a thin, transparent film, dries in a few minutes, when the process is complete.—*Scientific American.*

Removal of Glass Stoppers.—It may not have occurred to every one—at all events it is not noticed in any of our treatises on practical pharmacy—thst the easiest way to take out a stopper which has become fixed in the neck of a bottle is to reverse the motion given to it when putting it in, that is to knock the stopper from right to left. In most instances when a stopper is fixed, without the intervention of an adhesive substance, it is by turning it as one would drive a screw. The direction is almost invariably from left to right, and thus a thread is formed, which itis easier to follow backwards than to break. The trouble with which the removal of stoppers is nsnally attended must form an apology for introducing a suggestion of so little apparent importance.—*Canad. Phar. Jour.*

Artificial Ebony.—This is prepared on a large scale by grinding to powder 60 parts of charcoal obtained from sea-weeds, previously treated with dilute sulphuric acid and dried, and mixing it with ten parts of liqnid glue, five of gutta-percha, and two and a half of india-rubber, care having been taken to mix the two latter substances with coal-oil tar to render them gelatinons; then ten parts of coal-tar, five of pulverized sulphnr, two of pulverized alum, and five of powdered resin are added, and the mixture heated to 300° Fahr. After having been cooled, a substance is obtained which is equal in many respects to gennine ebony-wood, but fsr less expensive, and capable of receiving a finer polish.—*The Cabinet Maker.*

Preservation of Woon.—Mueller employa for this purpose the phosphate of baryta formed within the fibre. The wood is first atceped in a solution of the phoaphate of soda, containing seven per cent. of the salt. When dry, the wood is again treated with a solution of chloride of barium, containing thirteen per cent. The wood thns prepared rssists damp well.

Removal of Nitric Acin Stains from the Hands.—It ia said that a mixture of solutions of caustic potash and snlphate of ammonia will effect this object. It may be presumed that the akin will he removed at the same time of the stain.

To remove staina from marble, take two parts common soda, one part of pumice atone, and one part of finely-powdered chalk; pass these through a sieve and mix with water. Rub the marble with this mixture and wash off clean.

Value of Castor Oil.—A correspondent of the Germantown *Telegraph* writes: "We have nsed neatsfoot oil in its simple form and prepared in various ways, also the leather preservative oils, sold in cans at the stores; also all the oleaginous, butyraceous, and other lugubrious substances knowu to the farm-kitchen, but we give the preference over them all to castor oil. We have had boots a year old that we have oiled with it and the leather was soft, smooth and water-proof to the last time they were used. We apply it clear, without heat. A little lampblack might he used on old leather, but it is seldom necessary on new, as the oil itself seems to keep the blacking on and renders the leather black and of fine appearance. Those who have been annoyed with hard, cracked, water-soaked boots, the snrface of the latter rough without blacking, and the leather shrunken and wrinkled so as to chafe, gall and otherwiso punish their feet, will find castor oil well applied to he every way satisfactory. We have used it for wagons and buggies, and find that it is in every way snperior. It will wear longer, lubricate better and is the least objectionable of anything we know of. We use it very little at once, not enough to cause it to run off and catch dirt at the ends of the hubs."

Parisian Wood Varnish.—To prepare a good varnish for fancy woods, dissolve one part of good shellac in three or fonr parts of alcohol of 92 per cent, in a water bath, and cantiously add distilled water nntil a cnrdy mass separates ont, which is collected and pressed hetween linen; the liquid is filtered throngh paper, all the alcohol removed by distillation from the water bath, and the resin removed and dried at 100° Centigrade until it ceases to lose weight; it is then dissolved in double its weigbt of alcohol of at least 96 per cent., and the solution perfumed with lavender oil.

An Aoent for Removino Hair.—Professor Boettger recommends snlphydrate of sodium for removing hair from hides. The reagent is prepared by mixing one part hy weight of crystalline sulphydrate of sodium, with three parts by weight of fine chalk. It can be kept in closely stoppered vessels any length of time. When required for use, moisten a small quantity and apply it to the hide; in a few minutes the thickest hair is attacked, and can be removed by water. Too long contact would soon injure the hide.

Fastening Leather upon Metal.—One part of crushed nntgalls is digested six hours with eight parts distilled water, and strained. Glue is macerated in its own weight of water for twenty-fonr hours, and then dissolved. The warm infusion of galls is spread upon the leather, the glue solution upon the roughened snrface of the warm metal; the moist leather is pressed upon it and then dried, when it adheres so that it cannot be removsd without tearing.

An excellent marking ink can be obtained from the anacsrdium nut (*a. orientale*). The juice, it appears, contains an oily matter which becomes black on exposure to the air, and is proof against all known detergents and decolorizers, acids and alkalies, cyanide of potassium, and chlorine. If linen be marked with this natnral ink, and then moistened with a little ammonia, the black becomes very intense and is perfectly permanent.

Zinc Signs.—*The Manufacturer and Builder* gives the following recipe for lettering zinc labels: Two parts acetate of copper (verdigris), two parts chloride of ammonium (sal ammoniac), one part lamp-black, twenty parts water; mix well in a glass-stoppered bottle, and shake before using. For fine lettering you may apply it by means of a blunt-pointed steel pen.

Preserving Grinnstones. — A grindstone should not be exposed to the weather, as it not only injures the wood-work, bnt the sun's rays harden the stone so mnch as, in time, to render it useless. Neither should it stand in the water in which it runs, as the part remaining in water softens so much that it wears unequally, and this is a common cause of grindstones becoming "out of trne."

Bronzing and Varnishing Plaster Figures. These shonld be sized first, and painted with color according to the colored bronze required, as red, white, green, yellow, black, etc. Before the colors are thoroughly dry, that is, when they feel "tacky," the prominent parts should be bronzed with bronze powder, applied by a piece of chamois leather. Varnish afterwards with some quick drying varnish.

Pottery Varnish.—Coatings of lead oxide and salts are apt to dissolve off in acid liqnids, thereby threatening the health of those who use them. Several anccessive coatinga with a aolution of sodic ailicate, and then exposure to a bright red heat in a furnace, prevent any such solution from taking place when the vessels are nsed.

Indestructible Putty.—Boil 4 pounds a brown nmber in 7 pounds linseed oil for two hours; stir in 2 ounces of wax; take from the fire and mix in 5½ pounds chalk and 11 ponnds white lead, and incorporate thoroughly. The latter operation ia quite essential.

The heaping np of damp, waahed or sodden wool is very objectionable as favoring rotting, and at all events the wool spins badly, and will not dye well. A chromium or alum and tartar bath is the best to nse for sodden wool.

Good Health.

The Teeth.

Dr. Hayes, an eminent snrgeon-dentist residing in London, gives the following nseful hints abont the care of the teeth. They are simple, timely, and deserve attention:

"In the first place, the teeth shonld be fairly used. By this I mean, not made to perform the duties of crackers for nuts, experimented on to ascertain their strength, or by ladies to rival scissors in cutting thread; for rest assured—in every case, more particularly the last—the party having recourse to such practices will surely some day rne them; the teeth so unwittingly injured being always the first to part company from their fellows. Those who indulge in such or similar habits may truly be called the dentist's friends. Cleanliness is absolutely essential for the preservation of the teeth, and they should he well brushed at least morning and evoning, that any fecnlence which may be attached to them, either dnring sleep from the stomach, or by day from msals, may not he allowed permanently to adhore, cansing, firstly, discoloration, then tartar, and subseqnently, if I may so express myself, nndermining the constitution of one or more, as from their positioa they may be more or less liable to corrosion. In order that the teeth should look natural—that is, retain their natural color—a dentifrice free from the smallest particle of acid should be nsed at the matin hour, and the mouth rinsed with tepid water, for extremes of heat and cold are most highly prejudicial, not only to their color, but also to their durability; and I know no methed so simple of converting a really useful and ornamental set into one of pain and snbseqent extiuction, than the nse of washing in either one or the other. The person who habituates him or herself, to any extent, to hot soup, tea, or other drinks, assuredly rivals the friend to the dentist just named. Brushes for the teeth should be of medium substance of bristle, and those made on what is cslled the penetrating principle are best. I wonld also observe that children at an early age shonld be instructed in the use of the toothbrush, and tanght the value and importance of the teeth, in order to inculcate habits of cleanliness and a due appreciation of the ornaments of the mouth. A brush properly selected (not too hard) may be used by children of five years of age, every morning; and by being part and parcel of the general ablution, and thus directing habitual attention to the teeth, a useful and cleanly habit will be engendered which will insure for them proper care through life."

Study Beneficial to Health.

The London *Globe* editorially presents the following: True study is an eminently leisurely process, the great condition of success in it being deliberation, and though it always sufficiently intsrests the student to keep his facnlties lively, it seldom excites him to any dangerons degree. Hence I believe that genuine study is much less injurious to health than is often supposed—certainly much less injurious than many things that are scarcely reputed injurious at all. The processes of genuine and well directed study positively saves the brain by their rational and orderly seqnences by the safe advance from step to step. Study of this kind is like a well-built staircase, by which you can climb to a great height with a minimum of fatigue, never lifting the body more than a few inches at a time. Bnt as there might be snch a thing as racing up a staircase, so when we study against time, there is a strain in the more speed, however good may be the system we are following. There may also be a strain on the faculties in the direction of them toward a kind of study which is not adapted to onr natural gifts. If we learn what nature qualified ns to lesrn, and learn it step by step, without hnrry, we incur a minimnm of cerebral fatigae and gain a maximum of acquirement. Study of this kind gently stimulates and does not fatigue, nnless prolonged for an unreasonable length of time. It is positively favorable to health, because it is favorable to cheerfulness; it makes life pleasanter and more interesting, and so far from being injurions to the nervons system, gives it tone and vigor exactly as manly exercises give tone and vigor to the muscular system. There can be no doubt that men were intended to hear intellectural labor without injury to their health; we are constitnted to think and learn, just as a fish is constituted to awim or a bird to fly.

Sleep.—Infants cannot slsep too long; it is well when they can enjoy a calm and long-continued rest, of which they should by no meana be deprived, as this is the greatest support granted them by nature. A child livea comparatively much faater than an adult; its blood flows more rapidly, and aleep promotes more nniform circulation, and facilitates digeation while a horizontal position is favorable to growth and development. Still, sleep should be proportioned to the age. After six months, the time of sleep can be regulated. An infant should always aleep the whole night in preference to the day, and as it grows older, a few hours morning and afternoon; and, after a while, to aleep after dinner will be snfficient. After a child ia four or five years old, its time of sleep may be shortened one hour every succeeding year, so that a child of seven will not require to sleep more than eight or nine hours.

Domestic Economy.

House-Cleanino.—In cleaning a room, the carpst shonld come up first, not only because of the dust, but to give the floor all day to dry, not leaving it to be scrubbed last, as we have seen some had managers do, and pay for it by influenzas. Where the walls are papered, they should next be swept with a clean towel pinned firmly round a hroom, if there is not a brush kept for the purpose. The ceilings of chambers are nsually whitewashed; this is the next proceeding; and the walls scrubbed, if painted or hard finished. Then come windows and wood-work, in all things being careful to nse as little slop as will thoroughly answer the purpose. In cleaning wood-work, nse little soap, but plenty of clean water, which will prevent discoloration. If dirty spots and patches are wiped off the year rouud, faithfully, there will be mnch less need of scrubbing the boards bare in "house cleaning." Oak, or dark woods, now so much the fashion, need not he tonched, with good care, more than once a year; frequent dry rubbing will answer every pnrpose. Spots of grease may be removed from nnpainted floor by soaking and rubbing them with turpentine, and afterward washing it off with soap or pearlash. If they are inveterate, make a paste of a quarter of a ponnd of potter's clay, and the same quantity of pearlash, stirred into a quart of boiling water; spread a thick coat on the floor, and leave it ten or twelve hours.

To Clean Looking-Glasses.—Take a newspaper, or part of one, according to the size nf the glass. Fold it small, and dip it into a basin of clean, cold water; when thoroughly wet, sqneeze it out in your hand, as you would a sponge, and then rub it hard all over the face of the glass, taking care that it is not so wet as to run down in streams. In fact, the paper must only be completely moistened, or damped all through. After the glass has been well rubbed with wet paper, let it rest a few minutss, and then go over it with a fresh, dry newspaper (folded small in your hand), till it looks clear and bright—which it will almost immediately, and with no further trouble. This method, simple as it is, is the best and most expeditions for cleaning mirrors, and it will be fonnd so on trial — giving a clearness and polish that can be produced by no other process. It is equally convsnient, speedy and effective. The inside of window frames may be cleaned in this manner to look beantifully clear; the windows being first washed from the outside; also the glasses of spectacles, etc. The glass globe of an astral lamp may be cleaned with a newspaper in the above manner.

Roast Oysters.—There is no pleasanter frolic for an autnmn evening, in the regions where oysters are plentiful, than an impromptn "roast" in the kitchen. There the oysters are hastily thrown into the fire by the peck. You may consider that your fastidions taste is marvellously respected if they are washed first. A bushel bsske is set to receive the empty shells, and the click of the oyster-knives forms a constant accompaniment to the music of langhing voices. Nor are roast oysters amiss npon your own qniet supper-table, when the "good man" comes in on a wet night, tired and hungry, and wants "something heartening." Wash and wipe the shell-oysters, and lay them in the oven, if it is qnick; upon the top of the stove, if it is not. When they open, they are done. Pile in a large dish and send to table. Remove the upper shell by a dexterous wrench of the knife, season the oyster on the lower, with pepper-sauce and butter, or pepper, salt and vinegar in lien of the sauce, and you have the very aroma of this pearl of bivalves, pure and undefiled.

Rapin Picklino of Meat.—The following is an English recipe: Roll the meat in a mixture of 16 oz. salt, ¾ oz. saltpeter, and 1 oz. sugar, so that all parts may be completely salted; then wrsp closely in a piece of cotton cloth previonsly well scalded and dried, and place in a porcelain or other vessel. The cloth is essential with small pieces, to retsin the brine formed in contact with the meat. After about 16 honrs, however, some brine will drain off into the bottom of the vessel, and it will be necessary then to turn the meat, still wrapped up, daily. A piece of six ponnds, treated in this wny for six days, then nnwrapped and boiled, will be fonnd quite palatable and snfficiently pickled. For larger quantities the cloth may be dispensed with, siuce the brine formed will be sufficient to cover the mass, provided the pieces are closely packed, and any nnavoidable cavities filled with stones.

Scallopen Oysters.—Crush and roll several handfuls of Boston or otber friable crackers. Put a layer in the bottom of a buttersd pudding-dish. Wet this with a mixture of the oyster liquor and milk, slightly warmed. Next have a layer of oysters. Sprinkle with salt and pepper, and lay small bits of bntter upon them. Then another layer of moistened crumbs, and so on nntil the dish is full. Let the top layer be of crumbs, thicker than the rest, and beat an egg into the milk yon ponr over them. Stick bits of butter thickly over it, cover the dish, aet it in the oven, bake half an hour; if the dish is large, remove the cover, and brown hy aetting it upon the upper grating of oven, or by holding a hot shovel over it.

One ounce of fresh quick-lime dissolved in water, will soften two barrels of ordinary hard water, and render it fit for washing purposes.

MINING AND SCIENTIFIC PRESS.

Quicksilver Furnaces.

In other columns of this issue will be found letters from correspondents in relation to quicksilver metallurgy, which will be interesting to those connected with the mines as well as the general public. Our regular correspondence page being over full this week, we give place on this page to the following letter from the foreman of the New Almaden Mine, in relation to the subject of quicksilver, etc.

ENS. PRESS:—I noticed an article about "Quicksilver Extraction," in your issue of 4th inst., written by Hubert Bankert, in which he says: "In the New Almaden Works, I examined carefully the bricks of ons of the large condensers lately pulled down, and out of about 100 bricks, which I broke, scarcely one was not thickly permeated with metal, and in all the crevices of the mortar it poured out; neither can they ever be rendered sufficiently cool."

It seems to me very strange that Mr. Bankert should have made a statement so utterly at variance with the truth; the ore chamber and condeneers torn down were the last ones put up at these works, and their construction was entirely different from any of the other reduction works; they proved unsatisfactory, were only used for a short time, and then torn down for this very reason; the hundred bricks Mr. Bankert professes to have seen, and broken, could only exist in his imagination, as the whole furnace and condensere combined, did not contain that number of bricks, "permeated thickly with quicksilver."

But then as his article seems to be only written with the intention of recommending and lauding the old system of retorts, mixture of quicklime, concentration of ore, etc., (all of which was tried, and diecarded years ago at the Enriquetta Mine,) he probably thought that by depreciating the brick condensers, his invention would be much more admired by those who lack practical experience in beneficiating quicksilver ores.

F. FIEHLER,
Foreman, New Almaden Reduction Works.
New Almaden, Oct. 11.

CHRONIC.—For the last ten years, as winter approached, the papers of the State were rife in predicting early and heavy rains as likely to occur. Just previous to the late dash of rain, because the sky at times was slightly overcast, the same kind of prediction commenced again, and went from paper to paper, the round of the State. Now, since the shower has cleared up, all's mum.

Copper Ores.

On this Coast, though we have an abundance of copper ors, none of it is worked here, except what is mads up into bluestone. The few mines that make regular shipments, send their ore to this city, whers it is shipped and sent to Europe or to Baltimore. A great many people think that copper mines cannot bs worked here to a profit, because the business has been neglected, and because they think it is difficult to make any sales of their ores. This is erroneous; although none of the ore is smelted here, there are plenty of buyers in the market who buy to ship. This business should hs encouraged among us, as we have plenty of good copper mines, which only need development to be good paying properties. For the benefit of those who are unacquainted with the method of buying and selling copper ore we will give a short account of the way it is done.

Copper ores are bought by the unit or per cent. of copper contained, which, of course, depends on the grade of ore. Less than 16 per cent. ore is not very saleable. The price per unit varies here more than it does in the East or Europe, for ons reason, because we have to pay as much for the freight on low as on high grade ors. The scale of prices per unit at say $2.25 per unit for 20 per cent ors and $2.75 per unit for 30 per cent ore, for instance, ars for the following reasons: Suppose such ore to bs worth at home markets $4 per unit in gold.

20 per cent.@$4 per unit, equals $80 00 per ton at home.
Freight Insurance Commission, etc 36 00

Balance—20 per cent. @ $2.26....$45 00 per ton; price here.

Now if we take the 30 per cent. ore we have the following:

30 per cent. @ $4.00, equals $120 00 per ton at home.
Freight Insurance Commission, etc 37 50

Balance—30@$2.76..... $82 50

There is therefore a difference in charges on commission according to the percentage, and the insurance is of course higher on higher grade ore.

Most of the copper ore brought here comes from Nevada, but there are very few mines shipping 50 tons per month. The Battle Mountain Mine, Nev., belonging to English owners sends its ore here and direct to Liverpool on its own account, but most of the mines sell their ore here to buyers or agents. There are plenty of mines, which if worked vigorously, could produce a great quantity of ore for which there is a good market. Antimony and arsenic in any quantity in the ore disperses it in value, and in fact, almost ruin it. If such ore is shipped to this place, there is no sale for it, as good ore can be obtained. This class of ore is so expensive to smelt that smelters do not want it.

Moisture is to be taken into consideration in this connection, and it makes some considerable difference in the net weight of the ore. The Nevada ores as a general thing contain about two per cent. in moisture, but some run as high as three, four and five per cent. One mine—the Ella, in Nevada—has run as high as 20 to 25 per cent. in moisture. The carbonats ores never contain less than one per cent. moisture, but pure sulphuret ores sometimes contain as low as a tenth of one per cent. but generally three or four tenths. Most of the moisture is mechanically combined.

Almost all the ore that goes from here is sent by sailing vessels. Ships going "home" from here to England, except during the wheat seasons, are glad to get a layer of copper ore for freight, and sometimes it is taken very cheap. In shipping to Baltimore the ore first goes to New York and then by canal to its destination. Ships for there generally carry light assorted cargoes from this port, and want some dead weight, for which reason freight there is generally reasonable on ores. Ore can be sent from here to Baltimore, on an average, as cheap as it can be sent to Liverpool, on vessels, notwithstanding the additional expense of handling on canal boats, etc. Buyers for that place are in the market, as can be seen in our advertising columns.

The owners of copper mines who intend to ship, ought to send to disinterested parties who will see that the ore is properly assayed and sampled, and from whom the regular buyers can purchase. The ore on being sent here is systematically sampled by persons in the business. A certain proportion of the shipment is crushed and then spread out and thoroughly mixed over and over. From this samples are taken at random and placed in small bottles for the use of the assayer. By the method employed a good average of the whole lot is obtained. The seller takes his samples for assay and the buyer his. The assays are all made by the humid method and a certain proportion—one and three-tenths—is deducted, to agree with a fire assay. To show the means employed to get at the value of the shipment we will give an illustrative invoice or bill of sale of ore.

1 car load.....200 sacks.....20,000 lbs. gross.
Tare.....200 lbs.....
Moisture, as per assay, say 2 per ct.400..... 600

Net or dry weight.....19,400
19,400..... 8 684-2352 tons.
Sellers' assay..... .... 21.40 "
Buyers' assay..... 21.20 "

Average..... 21.30 "
Allowance for humid assay to fire assay..... 1.30 "

Net assay 20 per ct.
20 per cent..@$2.25 per cent.....$45 per ton.
8 684-2362 tons@$45 per ton..... 371.17 "

Copper ore always sells by the ton of 2,352 lbs., or 21 hundred weight (four quarters—28 pounds — making a hundred weight — 112 pounds).

The bluestone makers buy some copper ore but the demand from that source is limited. They prefer high grade carbonats ores. The bluestone men pay a high price for small lots as the demand for bluestone is good. It now sells at 12½ cents per pound, whereas in the spring and summer it sold below 10 cents. Birdsall & Co., of Dayton, Nev., make considerable of this material and as they supply their market—the Washoe mines—they have stopped the demand from Nevada for bluestone from this place. The orders have been decreasing ever since they first began to manufacture bluestone there.

Manufactures in a Mining Town.

In the mountains of Victoria, 96 miles from Melbourne, is the town of Ballarat, the foundation of which dates from the discovery of gold in 1851, when it became the center for supplies of the district, the mines of which are varied as they are in many of the mining centers of California. As the placers became poorer, the deep diggings were developed, followed by the working of the quartz mines. We often hear of the ability of the inhabitants of this district to work to a profit quartz that produces no more than $3 or $4 per ton. The temporary structures of 1851-2 soon gave place to substantial buildings for public use for manufacturing, and for stores and dwellings, many of every class of which would do credit to any city in any part of the world. There are hotels, banks, libraries, reading rooms, halls for lectures and public assemblages, hospitals, asylums, markets, etc.; they have their parks, their botanic gardens, cricket ground, race courses, pleasure grounds; they have cattle shows, agricultural and horticultural fairs, and also a school of mines for the practical training of those who desire to adopt mining as a profession or a business.

Of manufactures there must be many, for in 1867 some 45 meters were used in the supply of water to manufacturing establishments; among the most prominent now is the Phœnix foundry, which, established to supply the wants of the mines, employing but few hands, has developed into an extensive concern, fitted up with machinery, etc., with a force of 130 hands. This institution being able to undertake any business which offered, when the railway department invited bids to furnish ten heavy locomotives and tenders, bid for and attained the contract which amounted to £30,710. Since then they have entered into another contract to furnish 15 locomotives and tenders for the light lines of railways now in course of construction, the aggregate bids of the two contracts amounting to £81,320.

The materials for the 25 engines are imported in the raw state by the company; the only portions they do not manufacture are the wheels and axles, which the Government must find, the brass tubes for the boilers, and a few of the springs which even in England the locomotive builders procure ready made. The cost of the material imported was £30,000, the duty paid on which was £2,200. In addition to the duty, the company had to pay railroad freight to Ballarat to the amount of £1,000. Forty-five thousand pounds will represent the wages expended, and the profits made by the company on the two contracts. The first engine with its tender is of the class known as "six-wheeled, coupled, heavy-goods engine," with inside cylinders, 16 inches in diameter. The power is 510 nominal horse-power. The engine was subjected to a severe test, and gave perfect satisfaction.

In honor of the completion of this the first locomotive manufactured in the colony of Victoria, a banquet was given at which 180 gentlemen were present. The Chair was occupied by Mayor Smith, Chairman of the Board of Directors of the foundry. In response to the toast, "Prosperity to the Phœnix Foundry," he made a short speech, which was reported in the *Australasian*, and from which we make a few extracts as containing ideas of general interest in this as in all communities. He said he had been connected with the company from its commencement; when it was formed, comparatively few men were employed. An arrangement was arrived at between labor and capital which enabled the company to go on triumphantly. *He put labor first because without it capital could not exist.*

"The men in most cases were shareholders. When the profits of the undertaking were large enough to provide full wages for the workmen, the proprietors drew a full rate of interest on the capital they had invested. The workmen for three months only drew half wages; if at the end of the term the balance sheet showed that there was enough to pay full wages, they then got full wages. Full wages had been drawn by the men on all occasions except two since the company was formed.

"Something might be said of the establishment as a means of curing 'larrikinism' (i. e. hoodlumism). They saw 60 or 70 boys in it to-day. Some of them were employed in making the most delicate portions of the machinery. With some parts they had to be very particular indeed, because if they shaved ever so small a piece off, the part was ruined, yet he was informed that no parts had yet been set aside as marred. He was sure they must have been pleased with the youngsters when they noticed the manner in which they handled the machines. No public man who performs his duty, would neglect any means of providing employment for the generation which was springing up in the country. It was the duty of those who called themselves statesmen to make provision for the young, irrespective of what it might cost in the first instance. He believed that two or three of the most noted 'larrikins' in Ballarat, were furnished with employment at the foundry, but the work took the 'larrikinism' clean out of them! Let education be given the youngster and let him have fair and reasonable means of obtaining employment and we should not hear much of this cry of 'larrikinism'. When this contract was completed no English firm would be able to compete fairly and squarely with the Phœnix Company. The company intended that the artizans of this country should have a fair and reasonable opportunity of manufacturing what they were able to manufacture. He was assured that nothing could surpass the workmanship on this engine. It had no ornament—the Government required none—but if required it could be covered with brass. Those who constructed the complex and delicate parts of the machinery would not find it difficult to add ornament if needed."

From this it seems that our friends in Victoria have had trouble from "hoodlums" as well as ourselves and they have found a practical solution of the problem in establishing manufactories which gave them employment. This is what the capitalists of our city should do. Our manufactories here are limited in number as to variety and there are numbers of boys in the city out of employment. True, the hoodlum element is largely augmented by those who are really at work, but a few idle boys will in a measure corrupt a large number of laboring ones by setting a bad example. The establishment of manufacturing institutions, however, will tend greatly to decrease the hoodlum element in our midst. What has been done elsewhere can be done here, and our advantages are much greater than those of Ballarat.

Bullion.

The S. F. *Bulletin* gives the monthly shipments of bullion and dust through regular mercantile channels for the past nine months as follows:

1873.	Fine Gold.	Fine Silver	Gold Dust.
January.....	$198,684	$745,786	$1,680
February.....	69,954	393,162	3,230
March.....	129,237	393,080	300
April.....	331,845	627,250	538
May.....	129,429	1,264,142	4,926
June.....	308,664	796,019	365
July.....	385,587	698,627	2,557
August.....	898,797	976,718	2,920
September....	34,174	516,214	2,060
Totals.....	$2,487,371	$5,305,996	$18,486

The monthly shipments of coin for the same period have been as follows:

COIN MOVEMENT.

	Gold.	Silver.	Mexican.
January.....	$227,412	$10,000	$443,280
February.....	1,465,329	.....	315,448
March.....	1,776,302	5,940	249,255
April.....	1,015,696	700	265,008
May.....	229,768	6,000	327,682
June.....	285,096	100	328,639
July.....	218,758	9,488	236,622
August.....	200,586	116,060	334,213
September.....	788,182	46,600	119,770
Totals.....	$8,207,106	$193,886	$2,817,817

California Cattle and Vaqueros.

The large cattle ranges of this State, which are never separated by fences as in older countries, made necessary the adoption of some method by which the cattle of different owners could be recognized, In consequence of the herds becoming frequently mixed. The custom of branding was brought from the mother country by the early Mexicsn settlers, and is still ccntinued. To effect this object, *rodeos* are periodicslly held in csrtain localities, at which time the csttle belonging to different parties are branded with their respective marks and then turned loose. This custom is still in vogue in the southern counties of the State, but in many plsces has been discoutinued, as fewer cattle are kept, the land is fenced in and the country more settled up. A *rodeo* is, however, in progress this week on one of the large ranches in Marin county.

Without going into detail the method is as follows: The day for holding the *rodeo* is appointed by some of the prominent stock owners of a certain range of country. The large bands of cattle of perhaps fifty owners, which have been roaming during the year in the range are to be brought to a certain level spot at a convenient point for the purpose. All the *vaqueros* and ranchmen convene at the appointed place to share the work and sport, for sport it is to most of them and work for all. If there are "corrals" on the ground, so much the better, if not, horsemen are detailed to keep the different herds separated. Several fires are built where the brands are heated and the work hegins. The calves are recognized (as to ownership), hy the hrands in the cows they follow, so the same hrand is seared into their skin hy the men who have charge of that part of the business.

VAQUEROS "LASSOING" CATTLE.

The herders separate into bands, generally of three, and one of them rides into the herd, singles out a yearling and drives him into the open field. These men do not show the slightest hesitation ahont riding into the middle of the herd after they have singled out an animal. When the *vaquero* drives him out, another *vaquero* throws his riata over his horns and tries to slacken up his speed; meantime another riata is thrown over his hind leg and down he comes. Whsn necessary the third man dismounts, and the hull, by the aid of a sharp knife, quickly becomes a steer. If only to he branded, he is thrown as near the fire as possible and the hrand is applied. The riata is disengaged from the horns by one of the men, and by a quick motion and practiced turn of the wrist the man who holds the animal hy the hind leg, throws his riata loose and the beast is free. He is then driven off to the band in which he belongs. These men, however, become so expert that they can easily throw a stout hull with the aid of a riata and trusty horse. The method of doing this is shown in the spirited engraving accompanying this sketch. In these contests the strength of the *riata* is of more moment than the strength of the bull. When the vaquero is well mounted, as he generally is, after throwing his lasso over the hull's horns and taking a turn on the strong pommel of his Mexican saddle, there is a small chance for the bull.

These *rodeos* are scenes of enjoyment for the native Californians, who fairly revel in the sport. They are, without doubt, the finest horsemen in the world, and appear to the hest advantage on horseback. In this respect they are like sailors who, when ashore, are not particularly graceful in movement, and seem totally different from what they are. But in a gale of wind, aboard ship, the tar is in his element, and there is a certain romance connected with his profession which lends a charm to all his actions, and makes the clumsiest "shellback" for the time a model of grace. It is just so with these *vaqueros*. See them dismounted, in a watermelon patch eating *sandias*, in a cabin playing *monte*, or rambling idly, cigarreto in mouth, through the streets of a town, and these "greasers," as we call them, appear to be an idle, worthless set. Put these same men on a "bucking" *broncho*, kicking, biting and naing every endeavor to unseat his rider, or watch them single out and chase a vicious, long-horned steer at full speed, in all their leather and huckskin trappings, with jingling spurs, fancy hits and bridles, and wide, flapping *tapaderas*, and you would scarce recognize the same individual. He guides his steed by the slighest motion of the hody, appearing, Centaur-like, psrt of the horse itself, and seems to pay attention to anything rather than the animal he rides.

This class of men do most of the herding that is done on the large cattle ranges of this coast. The cattle themselves are mainly the common Spanish hreed, with large horns, lithe in body quick in motion, vindictive and possessing a courage and endurance which has made them famous. They have not the slightest fear of a man on foot—nnless he has a coil of rope in his hand—but when approached by a man on horsehack, behave themselves much more respectfully. Of late years a better hreed of cattle is springing up in our Stste, owing to the importations from the Esst, and it will not be very long before the long-horned steer will be a thing of the past.

Some mining operations are conducted as if governed hy spiritual advice, or with the view of spending the most money to obtain the least results, and owners and stockholders find out, when too late, that they have been "going it hlind." This is the result of faith. Now if people who have money to spend on a mine would employ none hut what they are satisfied is the hest ability -the most capahle captains and hest practical miners—instead of the cheap and indifferent ability and help too often employed, they would save at the hunghole thrice what is gained by the spigot policy. Or let these espitslists invest their money in some of the other sources of wealth in the region, which requires less faith than practical demonstration to prove success, and thus withdraw their pernicious influ·nces from the more prosperous mining operations.

The Horse-chestnut is now used in France for the manufacture of starch. The nnt yields about 17 per cent. of pure starch.

Bullion Drift.

Ths *Bulletin* of the 2d inst. says: It is interesting to watch ths ebb and flow of treasure to and from San Francisco. In former years, the channels were wsll defined and ths quantities sasily ascertainsd. The amounts brought to ths city by private individnals and carried away in the same manner havs never been known. It is probably true that the snpply offsets the dsmand in this respect, and hence it is immaterial to get at the facts, even if it were possihle. Of late ysars, ths public channels for the movemsnt of treasurs havs been somewhat disturbed. Formerly nearly all the bullion from the mines was shipped to this city. Now a considerabls portion goss dircct from ths mines to New York and other markets. This is one derangement. Auother is found in the shipment of coin and bullion through ths mails. There is no record kept of this movsment by the Post-office authorities, and hence it is impossihls to state the quantity thus sent. Most of the domestic treasure and a portion of the foreign trsasure received iu this city comes throngh Wells, Fargo & Co's Express. The amount received through this channel for the past quarter was $9,695,700, and for the nine monthe, $23,825,600. The details are as follows:

	Silver Bullion.	Gold Bullion.	Coin.
January	$295,261	$892,477	$917,197
Febrnary	333,375	635,326	621,152
March	332,677	653,915	865,979
April	1,298,128	795,404	614,546
May	1,842,283	855,470	687,133
June	970,862	976,613	652,204
July	1,168,758	1,176,298	934,243
August	1,346,993	1,208,133	671,680
September	1,643,506	833,687	722,629
Total	$9,211,843	$7,927,122	$6,686,663

The sourcee whence this treasure was received are indicated as follows:

From northern and southern mines	$19,760,997
From northern coast route	1,663,839
From southern coast route	558,687
From Mexico	1,842,105
Total	$23,825,628

The quarterly receipts of treasure through thie channel since January 1st compare as follows with the same time last year:

	1872.	1873.
First Quarter	$9,053,203	$5,437,368
Second Quarter	8,719,140	8,692,543
Third Quarter	9,356,000	9,695,727
Totsl	$27,128,343	$23,826,628

The receipts for the first quarter this year were unusually light, only $4,000,000 coming from the northern and southern mines, againet over $8,000,000 from the same sources during the pas. quarter. The comparison for the nine months shows an apparent falling off of $3,300,000, prohably due to dircct ehipments East from the mines. The coin movement to and from the interior has been ae follows.

	Recelved.	Remitted.
January	$917,197	$1,491,140
February	621,152	1,102,813
March	865,979	965,742
April	614,546	1,006,846
May	687,133	868,104
June	652,204	993,617
July	934,243	1,061,480
August	671,680	1,493,211
September	722,629	2,231,864
Total	$6,686,663	$11,204,716

The foregoing would seem to indicate that the country has drawu on the city for $4,500,000 more than it sent here. It is undouhtedly the case that more coin is brought to the city by private iudividuals than ie taken away in a like manner, and hence the above statsment does not accurately indicate the coin movement between the city and country. The drafts from the interior are the heaviest duriug the last halt of the year, particularly during the quarter ending September 30th, wheu the bulk of the grain crop is handled. The amount of coin aent into the interior during the past qnarter was $4,786,600, against $5,425,500 for the same quarter last year and $5,276,000 for the same quarter in 1871. The total amount of coin received from and sent to the interior during the first nine monthe of the year, compares as follows:

	Received.	Remitted.
1870	$4,800,223	$13,365,671
1871	9,383,836	12 254,887
1872	6,471,266	13,079,471
1873	7,686,663	11,204,716

We have received $215,000 more coin from the interior than we did last year and returued $1,815,000 less. The gold notee in circulation in this State largely take the place of coin in the exchanges hetween city and country. There is now over $2,000,000 of this currency in the five banks of the State, aud it ie interesting to etate that it is all coustantly in circulation, and there is room for more of the same kind, payable in coiu on demaud.

The Champion Team.—A team consisting of eighteen very large mules, and hauling a train of three prairie schoonere loaded with general merchandise, arrived in town yesterday evening from Wadsworth. The team is owned by Clem. Ogg, and is claimed to he the best team in Nevada.

The ahove bit of a blow comes from the *Borax Miner*, puhlished at Columbus, Esmeralda county. That team is a very diminutive affair, as compared with some of Pritchard'e broad-gauge traine plying regularly hetween Eureka and Palisade. Twenty-six mules, drawing six wagone and in the neighborhood of ninety thousand pounde of bullion, are not an uncommon occurrence in these parts. The *Borax* man will have to gear up more stock before he can lay claim to the honor of having ths "champion team of Nsvada." Eureka excels the world in the matter of coarse bullion and hig teams. We also consider ourselves a loug way above the avsrage as a charcoal-producing community. Each of our furnaces licks up, every season, a pile of charcoal almost eqnal in size to Mount Davidsou.—*Eureka Sentinel.*

Gold Mountain Mines.

The Reese River *Reveille* givss tbe followiug mining items from Gold Mountain:

John Frost has just returned from Gold Mountain and Lida Vallsy, where hs has besn for some time supsrintending the work of opening the mines belonging to ths company with which he is counected. He informs us that he is sinking on the Indspendent and Blue Gravel ledgss. On the former a dspth of 50 feet has been attained, disclosing a solid ledge of 6 fest in thickness. On ths Blus Gravsl a depth of 30 feet has heen reached also disclosing a well defined ledge of high grade ore. One sample which he brought in from the Independent was assayed at the Manhattan Mill, in this city and gave a result of $558 per ton. Following are the resnlte of some aseays of ore from these two ledges, made by J. D. Pringle, of this city: Blue Wing—silver, $31-42; gold, $25.01; Oriental—silver, $188.50; gold, $12.50; Oriental—silver, $417.84; gold, $125.58; Independent, silver, $873.50; gold, trace.

The company with which Mr. Frost is connected contemplates the erection of a mill as soon as warranted by the development of the mines; the machinery is now ready for shipment. A site for the mill has heen selected at Lida, where there ie an excellent supply of hoth wood and water. There are about twelve men now at Gold Mountain. Frank Higge ie Postmoster; hut is going to resign as the salary ($12 per annnm) is too small and the duties are ao arduous that he is unable to leave the camp.

Lida Valley.

At Lida Valley, Hiskey & Walker'e mill is rnnning eteadily and turning out bullion at the rate of $1,000 per day. The Brown's Hope, Cinderella and Blue Dick localities are being worked eteadily and are producing ore of a high grade. A quantity of ore from a ledge owned by Len Martin and othere was worked at the mill and yielded at the rate of $1,100 per ton. There are 75 men at Lida.

Mr. Frost expresses himeelf as highly pleassd with the appearance of the mines hoth at Lida and Gold Mountain and as having every confidence in the permauence and richness of the minee and the future prosperity of the districts. He intende returning in a few daye.

The San Juan Mines.

The Denver *Tribune* gives the following concerning the San Juan mines: "The immense and apparently iuexhaustihle mineral resonrces of the San Jnan District are as yet but little known to the masses. The papere of Southern Colorado have written up the distriots frequently and quite fully, and the *Tribune*, with its corps of special corrsepondeuts, has given detailed descriptions of a few of the more prominent mines, hut there are hundreds of rich discoveries of which not a line has been written, owing partially to the fact that the discoverers and owners have paid more attention to developing their property than to fnrniehing correspondsnts with facts relating thereto. We have to-day been put in possession of interesting facts regarding two of the hitherto almost unheard of mines of that district, the Mother Comstock and Swansea, of which a hrief description will he giveu.

The Mother Comstock

Was discovered in Jnne, 1872, by an old miner named Newcomh, who at one time worked in the famoua Comstock lode in Nevada. When he saw the vein he said that it eurpassed the latter in richnese, and that it should be called the Mother Cometock. It is located about a quarter of a mile from the Little Giant, on the same level. The vein of quartz is forty feet wide, and the vein of aolid mineral therein is from eight to fifteen feet in width. One assay, made at the U. S. Mint here, gave $1,484 in silver per ton. The lead has been traced for a distance of two miles and a half, showing it to be a true fissure. Every foot of this has been located. The main claim belougs to Messrs. Ketchum, Weitzel & Wallace, who have run a tunnel into it a distance of thirty feet, and pronounced the deposits as unlimited in value.

The Green Mountain

Is another of thoee immense deposits of eilver for which the district is noted. It is located half a mile east of the Mother Comstock, and has a vein of solid mineral from four to seven feet wide, with grey copper permeating every pait of it. Many aesays have been made, which gave $3,000 per ton in silver.

The Swansea

Was discovered in August, 1872, by Dr. E. F. Cameron, the discoverer of the great Moose mine, in Mt. Lincoln district. It is located two miles west of the Little Giant, at ahout the same elevation, and is owned by Ketchum & Cook. The vein is smaller than the two mentioned ahove, the vein of quartz being four feet wide, and that of solid mineral from two and one-half to three feet in width. This one assays from $400 to $3,000 per ton. The mineral is composed of sulphnrets of silver and grey copper.

Splendid water-power of abundant capacity for mining machinsry, is close at hand, and large forests surround ths mines, on the Las Animas River, at ths site of old Animas city, first sttled upon by Baker and his party, in 1862, are large beds of coal of excellent quantity and great extent, which can be hastily worked.

Engineer's Report of the San Joaquin R. R.

An Associated Prsss dispatch dated Stockton, 10th inst. says: At a meeting of the Sau Joaqnin Tulare Narrow-Guage Railroad Company yesterday, Engineer Archibald Blair suhmitted a full and exhaustive report. The eastern line from Stockton to Visalia, running from the Stockton to the Stanislaus river, thencs to ths north bank of the Tuolumne river, thence to the north hank of ths Merced rivsr, thence to Bsar Creek and Hundred-Mile Station, thence to the north hankof the San Joaquin river, thence thence to the north hank of King's river, to Visalia. Total length of line from Stockton, 175 80-100 miles. Greatest hight above tidewater, 460 feet. Maximum grade ascending south, 52 8-100 feet per mile; average grade per mile, 20 87-100 feet. Total length of bridging of all kinds, 20,570 feet. Total estimated cost of the eastern line, $1,973,166.89; average cost per mile, $11,223.23. The western line, running from Stockton to Stanislaus river, thence to the north bank of the Tuolumne river, thence to the north bank of the Merced, thence to Bear Creek and the 92-mile post, thence to the San Joaquin river, thence to the north bank of King's river, thence to Visalia. Total length of the western line from Stockton to Visalia, 164 miles. Greateet hight ahove tide, 373 feet. Maximum grade, ascending south, 47 52-100 feet; descending south, 31 68-100. Average grade per mile, 11 4-100 feet. Total leugth of bridging of all kinds, 23,582 feet. Total estimated cost, $1,878,448 53. Average cost per mile, $11,447 85. The excess of the average cost per mile of the western over the eastern is in consequence of the greater amount of bridging required on the western line. The average cost of bridging per mile is $1,855 14.

The Directors did not vote on the adoption of either line. A Committee was appointed to draft a bill, to be submitted to the next Legislature, to authorize the several connties to snbscribe to the capital stock, but not in the form of a donation. Under the present law, the capital stock of the company ie fixed at $500-000. The amount of stock eubscribed for to date is $188,000, and ten per csnt. paid. The cost of surveying has heen $5,728. It ie underetood the hill to he drafted authorizing counties to subscribe, will except San Joaquin. The next regular meeting of the Board will be on the second Wednesday in November.

Dunderberg and Jinksville Mines.

We are credibly informed that the difficulties between these two companies are so far adjusted as to allow work to be commenced at once; the final settlement being contingent on future arrangements between them. The exact nature of the case we have not tronhled ourselves to ascertain; for to the community, and to ourselves, ench businese negotiations are of no importance. We rejoice in the aesurance that the disputed mines are to be worked, but by whom, and uuder what agreement, are alike matters of no consequence, as the people will he equally henefited by the act hy whomsoever performed. We hope the present friendly settlement will ultimately lead to one of a permanent character, and thus relieve onr camp from the demoralizing effects of mining lawsnits; for while we desire our legal friends—and we have many of them—to reap such rewards as belong to the profession, we can but think their talents may be as well directed and equally remunerative when applied to the settlement of snch questions hy compromise, instead of the weariness and damaging procrastination incident npon this kind of litigation.

Our fellow towneman, Capt. Plater, has been appointed to the general management of the business of the Ruby, and we wish him succeas, as well on personal grounds ae for the general good the favorable results of any enterprise invariably hrings to the public. The smelting department will coutinue to be coutrolled by Mr. Hahn, whose long experience, thorough knowledge and complete success in the past, are sufficient guarantees for future reeults.

The known husiness ability brought into requisition by both these litigants in the preeent arrangement between them cau but induce the helief that it is mutually advantageous, and hence another impetus ie given to the mining interests of our already prosperous community. —*Eureka Sentinel.*

Pure Argentio Nitrate.—In the preparation of pnre nitrate of sliver from alloye, the copper alloyed with silver is now dissolved in nitrio acid, and the liquid is evaporated down, not to dryness, but to the coueistence of a thick oil. Concentrated nitric acid is then added. The nitrate of silver is precipitated in cryetals whilst the copper remains in eolution. These crystale are next repeatedly washed in concentrated nitric acid, when they retain no trace of copper.

Silver-lead—Smelting Furnaces.

Ths Oreana mine, Silver Lake District, mentioned by ns a few days since as a new and rich discovery, abont forty miles from Dayton and six milss southwest of Hinss's Hot Springs, has been purchased by John B. Winters, Lon Hamilton and Mr. Hobart, of this city. Ths purchassrs will at once proceed to erect two or three furnaces near their mins and begin the work of smeltiug. Thomas Alchorn, of this city, with three or fonr workmen as assistants, lsft hers last night on the Dayton stags for ths mine. Mr. Alchorn goes out to ersct a boarding and lodging house, stahles and othsr necessary buildings. The new proprietors of ths mine have just completed a road over which to haul lumber and all other neeced snppliss. The mine is on the summit of a high monntain, which on the east side slopes down to Walker River Valley. Around the hase of the mountain lies what is known as Nnt Pins Valley, which will afford an abundance of wood from which to make charcoal for use in the furnaces. The ore assaye $100 per ton in silver, and contains from seventy to eighty per cent. of lead. The mine has been developed thus far by meaue of a perpendicular shaft, but the nsw proprietore will run to the lead three tunnsls at euitahle dietances down the side of the mountain. Owing to the peculiar sitnation of the vein it may be tapped at an immenss depth. Two or three companies are at work on extensions of the Oreana, and have not only found the vein, but have found large deposits of good ore. Should the new enterpriss provs as profitable as it promiscs, the many veins of argentiferous galena to he found in varions parts of this section of the State will donbtlsss he pretty closely looked after by onr prospectors.—*Territorial Enterprise.*

Mining Claim Sold.—The Placer *Argus* says: On the 31st of March last, O. Bunker, L. E. Seamen and W. C. Shain, owners of the El Dorado Hill mining claim, sitnated about one and one-half miles northeast from Michigan Bluff, bonded their claim to Gen. George S. Dodge for the sum of $15,000. By the terms of the bond they received $4,000 down and ths balance to he paid at the expiration of six months, if the sale was consummated. Gsn. Dodge immediately commenced fitting up the claim with the most improved modern apparatus for working the same, having expended in doing so over $6,000. The time given having expired on the 1st day of Octohsr, Messrs. Seaman, Bunker and Shain called on Messrs. Hubbard & Andrews, agents of Wells, Fargo & Co., in Auhurn on that day and were informed that the halance of the money, $11,000, was awaiting their order, the parties for whom General Dodge was operating having concinded, after a thorough prospect of the claim, to take it. The claim conaists of 160 acres of gronnd, and in a fair season they are enabled to have a supply of water for hydraulic purposes of from six to seven months. When the Iowa Hill Canal is completed it will give them a supply ths year ronnd. The claim has been worked and prospected for the past six months nnder ths supervieion of Mr. William Walsh, an experienced, thorough-going, energetio miner, to whom great credit is due for the manner in which he has managed the eame.

A Good Binder for $1.50.

Snhscribers for this journal can obtain our Pstent Elsstic Newspaper File Holder snd Binder for $1.60—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may he quickly fastened and retained in book form at the end of the volumo, and the binder (which is very durahle) used continuously for subsequent volumes. Post paid, 26 cts. extra. It can he used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press. 1ambp

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS
Also, MINING PARTNERSHIP LAW.

A pamphlet containing the ahove provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, Dewey & Co., Publishers, snd Patent Agents, S. F.

A NEW BOOK ON MINING.

The Explorera', Miners' and Metallurgist's Companion; Comprising a Practical Expositon of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by Dewey & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every Intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address DEWEY & CO.,
PUBLISHERS, PATENT AGENTS AND ENGRAVERS,
No. 338 Montgomery street, S. F.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees: list of Government fees, practical hints, etc., etc. Address DEWEY CO., Publishers and Patent Agents, San Francisco.

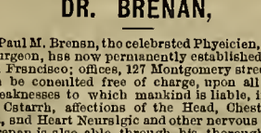
DR. ABORN,
Physician and Operating Surgeon
FOR CHRONIC DISEASES,

213 OEARY STREET, - - - SAN FRANCISCO.

Diseases of a chronic and obstinate character, especially such cases as have for years, or a lifetime, resisted the ordinary modes of treatment, are the class of maladies in the treatment of which Dr. Aborn has become pre-eminent on the Pacific Coast, as well as throughout the Union, and by his success has acchieved for himself an enviable reputation. 23v25-1y



19v26-1y

DR. BRENAN,

Dr. Paul M. Brenan, the celebrated Physician, Lecturer and Surgeon, has now permanently established himself in San Francisco; offices, 127 Montgomery street, where he can be consulted free of charge, upon all diseases and weaknesses to which mankind is liable, including Nasal Catarrh, affections of the Head, Chest, Throat, Lungs, and Heart Neuralgic and other nervous diseases. Dr. Brenan is also able, through his thorough knowledge of Physiognomy and Phrenology, to read a man's character at sight, advising him of his principal characteristics, and what path of life it would be best for him to pursue. Phrenological examinations given daily. Correspondence promptly answered.

Private and confidential correspondence may be addressed to lock box 291, post office, S. F.

Offices—127 Montgomery street. Hours, 10 to 12 A. M., 2 to 5 and 6 to 8 P. M.

The Poor prescribed for free every Thursday afternoon. 9v27-3m

The California Powder Works
No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH
ROCK DRILLS
—AND—
Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Roehling.....East River Bridge Company, N. Y.

For further information, etc., address

L. C. PARKE,
VIRGINIA CITY, NEVADA.
AGENT FOR THE PACIFIC COAST. f15

NOTICE TO BUILDERS.

SEALED PROPOSALS, for furnishing certain materials and constructing a portion of the Napa State Asylum Building for the Insane, will be received at the office of the President of the Board, No. 204 Sutter street, San Francisco, until 12 o'clock M. of the 30th day of October, 1873.

The printed specifications and printed forms of proposals can be had on application to Messrs. Wright & Sanders, Architects, 418 California street, where plans and drawings can be seen and all further information obtained. No bids will be entertained unless made on the specified printed forms of proposals and accompanied with a certified check or bond with two or more good and sufficient sureties, in a sum equal to ten per cent. of the total sum of the tender, to be returned on the due entering into the contract by the party to whom it may be awarded, or to be forfeited if the party fails to enter into the said contract.

The Board reserves the right to reject any or all bids.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., October 11th, 1873.

FOR WEEK ENDING SEPTEMBER 30TH, 1873.*

MECHANICAL KEY AND SOUNDER FOR TELEGRAPHS.—David L. Parkhurst, S. F., Cal.

BEE-HIVE. — George Miller, Battle Ground, Washington Ter.

TRADE-MARK.

WINDMILL.—Atwood & Bodwell, S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Our Sugar Trade.

Of all the articles that we import from foreign countries for our home consumption, Sugar comes next in value to Tea, and in weight exceeds all, it taking even more tonnage to import Sugar than to import Iron or Coal of all kinds. Hitherto our imports of sugar have been mainly confined to the supplies needed for the consumption of this Coast, but with the rates of fare on the railroad fixed at any reasonable figure, we may hope to extend our commercial domain in this one article as far as Chicago, and to take in all the States west of Indiana, Kentucky, Tennessee and Mississippi, embracing a population of about twelve millions. At present the rates are against us so that it costs much less to transport goods from St. Louis or Chicago to points on the borders of the States, than it does to send from here the same distance eastward. This has caused the experiment of the California Sugar Refinery in sending refined sugars to Chicago and St. Louis to fail. But we hope for better things and for a policy on the part of the railroad that will foster the trade of San Francisco with the States and Territories to the East. It would be the wisest even for the railroad in the end. Had we the trade of the States and Territories we have mentioned secured to our city, we would

Need to Import Twelve Times the Quantity

That we do now. These need for consumption fully eight hundred millions of pounds annually, and would give employment in this city to fifty refineries of the calibre of those that we now have. And as there are over four hundred men now employed in the business, they would give employment to 4,800, whom with their families and trades-people supported by them would number over 20,000. We shall have this ultimately. By and by, not one, but half a dozen railroads will reach out their arms from this city to meet the embraces of the East. Besides the Central Pacific, we already have of projected roads—the Texas or Southern Pacific, the Colorado Pacific, the Kansas Pacific and the Atlantic and Pacific, all of which are destined to have their termini in this city. The future sugar trade of San Francisco will mount up into values of hundreds of millions of dollars. Hitherto we have had but one local trade, we have had no foreign trade to supply. In twenty years more we shall task the resources of the Sandwich Islands, the Manillas, and Central America to supply us with our raws. In the annexed table will be found statistics of the imports for the last eighteen years, beginning January, 1855:

YEAR	IMPORTS IN POUNDS.	INCREASE OVER PRECEEDING YEAR.	DECREASE FROM PRECEED'NG YR.
1855	11,261,567	.....	.....
1856	12,539,946	1,338,379	.....

THE "COMMISSION MERCHANTS" GRANGE.—We see by dispatches to the Associated Press, that the Bostou Grange, oomposed of grain and commission merchants, having been ordered to dishand by the Grand Master of the National Grange, as it was not a Farmers Grange, threatens to carry the matter before the National Grange. The dispatch says the Boston Grange retains its books and rituals; the members using the pass-words and grips of the Order. Ae it is composed of prominent business men, the associated press reporter thinks a warm contest is promised, but we opine that if the members of this Grange are not of the proper kind, the matter will be very summarily disposed of, as just such occurrences as this were likely to occur. The proper measures to prevent troubles of the kind have been taken, and if the Boston Grange was one of an improper kind, the Boston Grange will not he in existence for any length of time. Enemiee of the movement will no donbt rejoice, thinking that internal dissensions in the Order will do it harm, but the Grangers are too earnest in their work not to have made ample provieions against any euch contests.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco

PACIFIC TRANSFER Co., Oct. 6.—Object: To carry freight, baggage and merchandise to and from all railroad depots and steamer landings, and to do a general and local express business. Directors: J. D. Fry, George F. Maynard, F. A. Hyde, J. Henley Smith and E. J. Coleman. Capital stock: $100,000.

MAXWELL HYDRAULIC M. Co., Oct. 6.—Object: To extend the Maxwell Mining Company's ditch, in Plumas county, in this State, down Spanish Creek and the Feather River, to a point about twenty-five miles. Directors: Stephen J. Clark, Daniel Swocucy, Thomas B. Prince, Hugh Corbett, J. W. Crawford and D. P. Barstow. Capital stock: $600,000.

SONOMA QUICKSILVER M. Co., Oct. 6.—Location: Sonoma county. Directors: J. D. Fry, C. N. Felton, G. W. Grayson, H. P. Wakelee and G. S. Dodge. Capital stock: $3,000,000.

COLORADO COMMERCIAL LAND Co., Oct., 6.—Object: To carry on business operations in California, Arizona, and in the State of Sonora, Mexico. Directors: Peter Donahue, Juan A. Robinson, Edward Martin, N. K. Masten, C. M. Hitchcock, Phillip A. Roachand Samuel Purdy. Capital stock, $5,000,000.

Meetings and Elections.

CAROLINE M. Co., Oct. 15.—Trustees: Hill Beachy, R. R. Given, C. W. McKecney, R. H. Rogers and Henry Raymond.

JULIA GOLD AND SILVER M. Co.—Trustees: Hill Beachy, Thomas Cole, M. Schmitt, M. D. Townsend, Robert Tracy. The last named gentleman was subsequently elected President; R. K. S. Latham, Treasurer; A. Noel, Secretary, and Frank M. Thayer, Superintendent.

ATWILL & Co. make a business of attending to the interests of shareholders and locators of minee, and conduct a general mining agency in this city. Parties desirous of obtaining their services in business of this character can learn their address hy referring to our advertising columns.

Asiatic Cholera in China.

ALMOST EVERY CASE CURED WITH

PAIN-KILLER!

DEAR SIRS: During a residence of some ten years in Siam and China, as a missionary, I found your Pain-Killer a most valnable remedy for that fearful scourge, the Cholera.

In administering the medicine, I found it most effectnal to give a teaspoonful of Pain-Killer in a gill of hot water sweetened with sugar; then, after about fifteen miuntes, begin to give ahont a tablespoonful of the same mixture every few minntes until rclief was obtained. Apply hot applications to the extremities. Bathe the stomach with the Pain-Killer, clear, and rnb the limbs briskly. Of those who had the Cholera, and took the medicine faithfully, in the way stated above, eight out of ten recovered.

REV. R. TELFORD, Missionary in China.

DEAR SIRS: During a long residence in China I have used your valnable Pain-Killer, both in my own family and among the Chinese, and have found it a most excellent medicine. In the summers of 1352 and 1863, while residing in Shaughai, I found it an almost certain cure for cholera, if nscd in time. Indced, nsing it in a great many instances, I do not remember failing in a single ease. For three years I have been residing in this place, more than fifty miles from a physician, and have been obliged often to fall upon my own resources in cases of sickness. The Chiuese come to us in great numbers for medicine and advice. Though without medical knowledge ourselves, the few simple remedies we can command are so much in advance even of their physicians, that we have almost dsily applications. We allow them to come, because it brings us in contact with them and opens a door of usefulness. In diarrhea, colic, vomiting, cholera, conghs, etc., your Pain-Killer has been my chief medicine. Yours, very truly,

REV. T. P. CRAWFORD, Tungchow, China.

Those using Pain-Killer should strictly observe the following directions:

At the commencement of the disease, take a teaspoonful of Pain-Killer, in sugar and water, and then bathe freely across the stomach and bowels with the Pain-Killer clear. Should the diarrhea and cramp continno, repeat the dose every fifteeu minutes. In this way the dreadful scourge may be checked and the patient relieved in the course of a few hours.

N. B.—Be snre and get the genuine article; and it is recommended by those who have used the Pain-Killer for the cholera, that in extreme cases the patient take two (or more) teaspoonfuls instead of one.

The PAIN-KILLER is sold by all the Druggists and Dealers in Family Medicines.

☞ Price, 26 and 50 cents and $1.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

WEDNESDAY M., Oct. 15, 1873.

The market has shown considerable movement of late, especially in Cornellians and all kinds of French Calf Skins. Eastern Sheep Linings are also in request. Altogether it may be said that the Leather trade is improving on its late depressed condition. Much more business is down now than a few weeks since, and the general feeling is much more hopeful.

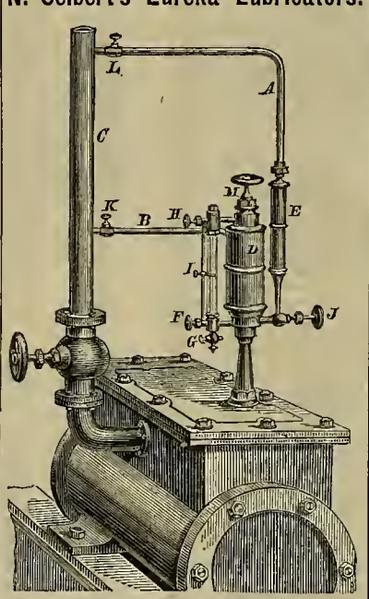
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tubo I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

☞ BUY BARBER'S BIT BRACE. ☜

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,

Parshall's Lubricator for Steam Engines.

These Lubricators are suited to all steam Engines, delivering the lubricant, whether tallow or oil, to every kind equally well. They are subject to be placed in the steam pipe, steam chest cover or the cylinder head, as is desirable. They admit the steam freely to the lubricant, which is constantly saturated with it and kept thereby in a free liquid state. When condensation of the steam begins, the water settles below and raises the oil to the top. The oil is fed from the top of the cup, through a tube which passes down through its center. All sediment in the oil settles to the bottom of the cup, and the oil, on going to feed the engine, is always pure. By simply turning a screw in the top of the cup, the flow of oil is regulated to suit the requirements.

We have numerous testimonials from Railroad Engineers and others, speaking in the highest terms of their superiority. The first one put in use on this coast is at the Pacific Saw Manufactory in this city. Parties desiring further information will please send for descriptive circular and price list, or call at our office.

WIESTER & CO.,
General Agents for the Pacific Coast,

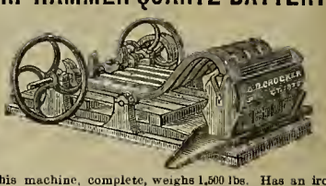
CROCKER'S PATENT
TRIP HAMMER QUARTZ BATTERY.



This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 2,0 0 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $300.

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

SHEET IRON PIPE.

THE

Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

☞ All kinds of Machinery made and repaired.

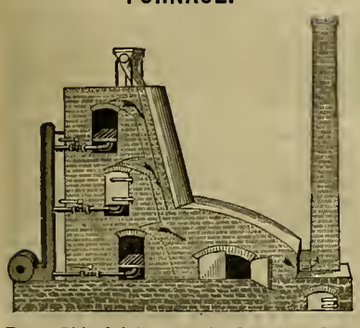
Metallurgy and Ores.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions reudered regarding tbe validity of Patents and Assignments; every legitimate brancb of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of tbe various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The sbrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to tbe notice of tbe public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New Soutb Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and cbanges of foreign patent laws—agents wbo are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than tbose of any otber responsible agency.

We *can and do* get foreign patents for inventors in tbe Pacific States from two to six montbs (according to tbe location of tbe country SOONER tban any otber agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us witb tbe character of most of the inventions already patented; hence we are frequently able to save our patrons tbe cost of a fruitless application by pointing them to tbe same thing already covered by a patent. We are always free to advise applicants of any knowledge we bave of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected witb inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a sbort call at our office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it bas repeatedly happened tbat applicants have not only lost their money, but their inventions also, from this cause and consequent dclay. We hold ourselves responsible for all fees entrusted to our agency.

Tbe principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and bave full records, of all former cases, and can more directly judge of tbe value and patentability of inventions discovered here than any otber agents.

Situated so remote from the seat of government, delays are even more dangerous to tbe inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured tbat their communications and business transactions will be beld strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machiuery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrous in bringing their valuable discoveries into practical and profitable use.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respectivs Metals without Quicksilver. 1870.

This rars hook on ths treatment of gold and silvsr ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and conciss descriptions of varions processes and apparatus employed in this country and in Europs, and sxplains the why and whsrefors.

It contains 142 pages, embracing illustrations of furnaces, implemsnts and working apparatus.

It is a work of great msrit, by an author whose rsputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postags free.

Concentration of Ores (of all kinds), including ths Chlorination Process for Gold-bsaring Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled hy any other puhlished, embracing the suhjscts treated. Its authority is highly esteemed and regarded hy its rsaders; containing, as it does, much essential information to the Minsr, Millman, Metallurgist, and other profsssional workers in ores and minerals, which cannot be found slsswhers in print. It also abounds throughout with facts and instructions rendsred valuable by being clearly rendered together and in simpls order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest valus. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Puhlic of California and Nevada, with full explanations and dirsctions for all metallurgical operations connected with silver and gold from a prsliminary examination of ths ors to ths final casting of the ingot. Also, a description of the gensral metallurgy of silver ors. 1864.

As its title indicates, this work gives a wide range of information, applicahls to all vein miners and worksrs in precious metals, affording hints and assistancs of exceeding valus to hoth ths modsratsly informed and ths most expsrt operator.

Price, $5 in cloth; $6 in leather—coin.

HALLIDIE'S Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from ths mine to ths mill, Earths for smhankments, Rock from quarries, etc., hy means of steel wire rope, has heen well tested and found more economical, advantageous and reliahle than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of thoss interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of ths HALLIDIE TRAMWAY put up hy you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ors per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, thers is nothing about it to ever get out of order—nothing to wsar out. While ours requires but about two thousand five hundred feet of wire rope, I can ses no rsason why the line could not hs sxtended almost indefinitely with equally happy results. Again, the carrying capacity might be douhled or quadrupled if desired. Aftsr ssveral weeks trial upon our mine, ths unanimous verdict of all who have seen it is a complete, unquestioned success. If this can hs of any service to you, use it in any way you think propsr. Very respectfully, C. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah,
Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elsvated wire tramway, which carriss its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that oven approaches them in the facilities they afford for moving ore at all ssasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one t n and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can he worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 21, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, OCTOBER 25, 1873.

VOLUME XXVII Number 17.

Krom's Dry Ore Concentrator.

In a recent issae of this journal we gave at length the details of the workings of the Krom dry ore concentrator at Star Cañon, in this State, and the satisfactory resnlts accomplished there have attracted coneiderable attention to the machine. For the henefit of those who are unable to eee the machine in operatioa we present in this number drawings of the concentrator ae promised before. Figure 1 ie a perspective view of the machine and figure 2 is a transverse eectional view.

The machine is compoeed essentially of the following parts: A receiver, *H*, to hold the cruehed ore; an ore bed, *S*, on which the ore ie submitted to the action of air; the two gatee, *G G*, one to regalate the flow of ore from the receiver, *H*, the other to determine the depth of ore on the ore-bed; a paseage, *C*, in which the concentrated ore deecende, and roller, *R*, to effect and regnlate the discharge of the same; a fan, *B*, to give the puffs of air; a trip-wheel, *K*, lever, *A*, and spring, *E*, to operate the fan; and a ratchet-wheel, *W*, and pawl, *P*, to impart revolution to the roller, *R*.

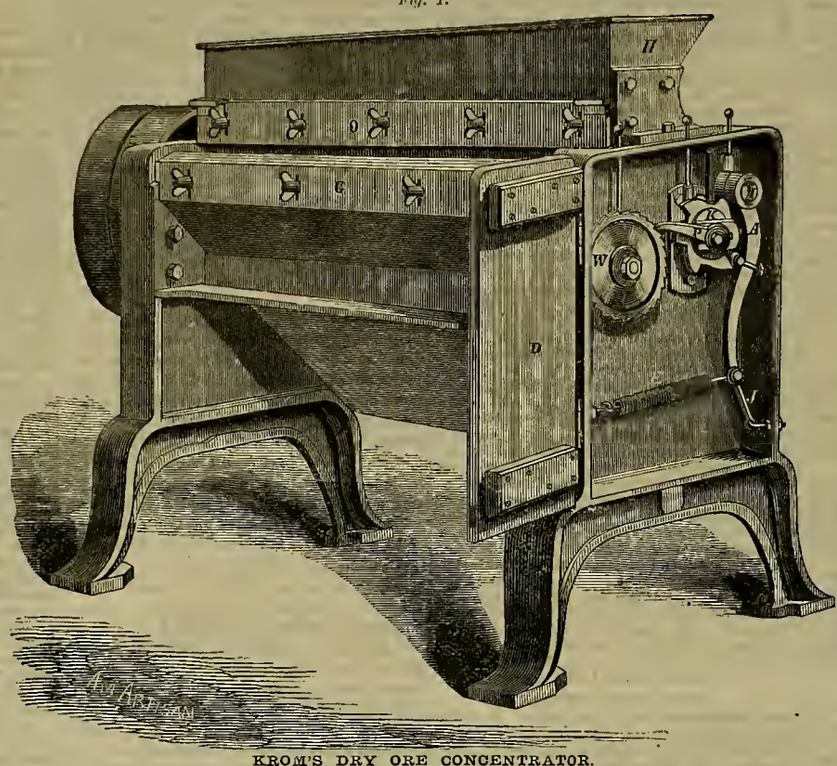
The mode of operating the machine is as follows: Ore is placed in the receiver, *H*, and the driving pnlley eet in motion. The trip-wheel, *K*, fixed on the opposite end of the pulley-shaft, works, by its cam-ehaped teeth, against the lever, *A*; and, by the alternate action of this wheel, forcing the lever in one direction, and of the spring, which at once and enddenly carries it back again, the fan, *B*, is made to swing on the ehaft, *I*, eending at each npward movement a qnick and eharp puff of air through the ore-bed, and lifting elightly the ore lying on it. As there are six projectione upon the trip-wheel, it follows that the moderate speed of 70 to 80 revolutions of this per minute will give 420 to 480 npward movements of the fan, in the eame time, and conseqaently a correeponding nnmber of puffs of air to agitate the ore. This rate is enfficient to secure a steady motion of the heavy halance pulley, and yet not so fast as to prodnce any unpleasant jar or noise—the machine working smoothly and eaeily.

The ore-bed is composed of wire-gauze tnbee, placed at dietancee from each other of one-fourth to three-eighths of an inch, according to the gradee of ore to be concentrated—the finer requiring that the tnhee be set nearer together, while the coarser allow of their being further apart. The ore-bed, situated in front of the fan, as plainly shown in the sectional view, ie formed by these tubes—their ende next to the fan being open; and the air from the fan entering theee, escapes throngh the top and sidee of the tubes, agitating the ore that lies on them, and also that between them near the eurface.

The ore between the tubee reste on that immediately underneath, in the paeeage, *C*, and ainke ae fact as the roller, *R*, at the bottom, effecte ite diecharge. The tubee being open on the lower side, any fine ore paseing throngh the meshes of the wire-ganze eimply descende with the main body, *C*, thue preventing any liability of the tnbes to fill np.

In diecharging the concentrated ore, *C*, the roller, *R*, ie operated (as mentioned above) by means of the rachet-wheel, *W*, and pawl, *P*; and, the latter being carried by a crank on the trip wheel, it follows that its speed is governed hy the speed of the wheel, which aleo gives

Fig. 1.



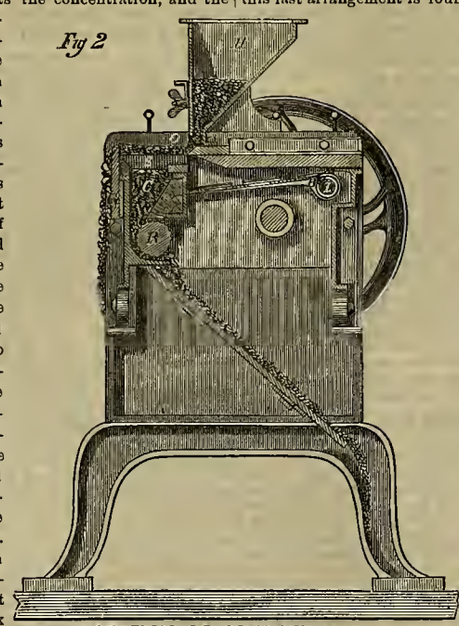
KROM'S DRY ORE CONCENTRATOR.

motion to the fan, *B*. By thie connection, the fan, which effects the concentration, and the roller, which discharges the concentrated ore, are made to act in concert with each other. The importance of this feature will be apparent when it is rembered that the amount of ore concentrated in a given time depende on the number of puffe of air eupplied per minute; so that, as the arrangement here eecures, the motion of the discharge roller ie controlled and regulated to correepond with the epeed of the fan.

To accomplish more satisfactorily the resnlt sought, the crank which carries the pawl can also be adjneted, by varying ite length, so that the speed of the roller may be further regulated, according to the richnees of the ore.

Ae already intimated, the upper gate, *G*, governs the flow of ore from the receiver, *H*, to the ore-bed; whilst the lower gate, *G*, is eo set ae to determine the thickneee of the stratum of ore lying npon the latter; the reaeon for this last arrangement is found in the neceseity of increasing or diminishing the depth of the hed of ore operated on, according to the coarsness or fineness of grade — the finer the crushed ore the thinner should the stratum be.

Fig 2



SECTION OF CONCENTRATOR.

The strap, with its screw fastening, servee, first, to prevent the roller-attachment of the lever, *A*, from striking the body of the trip-wheel, as it falle from each of the cam-shaped projeotions; and secondly, to regnlate the extent of movement of the fan. Further, by tightening up or slacking off by means of the screw fastening, the fan is carried in its vibrrtion through a greater or lese epace, producing, accordingly, a etronger or lighter pnff of air.

The puffs of sir are, at the start, regalated to agitate snfficiently the ore on the hed; bat should the richness of the latter increaee during working, or too large a sapply collect at one time on the bed, the sir ceseee to lift or sgitate the material eo mnch as before; and thne a check ie at once furnished to prevent loee by the overflowing of heavy ore in the tailings. No euch check ie poesible in water concentration; because wster moves practicslly as a eolid, and carriee all before it.

All the parts of thie machine liable to wear in course of time are manufactured duplicste, and can accordingly be cheaply reproduced. The concentrator messuree five feet in length, two feet in width, and three feet ten inchee in hight. It weighe, complete, 1,000 ponnde, and the sgente inform us is cspable of concentrsting half a ton per hour, with one-eighth horse power.

All the mills in Gold Cañon are buey crashing rock from the Crown Point, Belcher, Consolidated Virginia, Hsle & Norcroes and other Cometook mines. The *News* givee the following as the cspacity of the different mills: The Trench mill ie running on Hale & Norcroes rock, and ie crushing about eeventy tons per day. The Bacon ie orushing sixty-five tone per day of Silver Hill rock. To-morrow the mill will commence running on Consolidated Virginia. The Hope mill ie snpplied with ore from the Dayton mine; ite working capacity thirty tons per day. The Excelsior mill, capacity twenty-five tons per day, ie crushing Juetice rock. The Devil's Gate mill is ruaning on Crown Point ore; capacity thirty tons per day. The Pioneer mill is snpplied from the same mine; capacity forty-five tons. The Pappoose mill, capacity eixteen tone, is runniag on Belcher ore. The Atlas ie snpplied by the Crown Point; capacity fifteen tons per day. The Kelsey is ruaning on Belcher rock; capacity forty tons per day. We are not informed ae to the working capacity of other mills not ennmerated in thie list.

The Pioche papere deplore the fact that more attention is not paid to the low grade ores of Highland and Bristol Districts. The *Record* eaye that there is little doubt among experienced men that there ie a great deal of ore in them which it would pay to work, if properly managed. Such being the case, it is somewhat singular that the minee iu theee campe have not yet been more fully developed.

The Amador County people have come to the concluaion that they muet help themeelvee, and not wait any longer for foreign capital to develop their minee. The *Ledger* thinke that inetead of the placer mines being exhaneted, the businese of workiag them hae scarcely been commenced.

Function of Potash-salts in Aoriculture.—Nobbe maintains that potaeh-ealts in eoils are neceseary in order to enable the chlorophyll graine of the leaves to form starch. Sodinm or lithium are unable to replace potaseium in thia function, and the latter is eveu positively hurtful. The chloride of potaseium ie the moet effective form ia which thie element can be eupplied to the soil.

Lead Poisoning ie very prevalent in many of the "haee metal" dietricte of the coaet, particularly in Salt Lake.

CORRESPONDENCE.

Notes of Travel in Lander County, Nevada.

[By our Traveling Correspondent.]

Reese River Mining District.

The mines of this district ars within an area of thrss miles of the town of Austin, ths county-seat of Lander Co., midway between Belmont, in Nye Co., and Bsttle Mountain Stsation on the C. P. R. R., the point yon take the stags fiom, for the mines in the district; the distanoe from Battle Mountain to Austin is 95 miles in a sontherly dirsction; the stage lins plying between the above mentioned pointe is owned by O. Tuller & Co.; this line runs daily; time occupied in transit, 17 honrs; fare, $15. The population of the town of Anstin is about 2,000, and the olevation 6,275 feet above tide water. The

Principal Mines of this District

Ars the Manhattan S. M. Co., (of Nevada,) the Savannah S. M. Co., Mohawk S. M. Co., Lone Star, the South Sonoma and S. C. Baker mines. The three latter are not incorporated, bnt owned by from one to three proprietors each, and are being developed to the best advantage, taking ont ore in paying quantities. The three former are incorporations, and doing the largest portion of the milling and mining of this district. Allen A Curtis, Esq., is Superintendent of both the Mohawk S. M. Co. and

Ths Manhattan S. M. Co.

The latter mentioned company is employing some 30 men in and around their 20-stamp mill, which mill is reducing ahout ono ton to the stamp every 24 honrs. They also give employment to about 165 meu on contract work in their mines. They have a fine set of steam hoisting works and own some 72 ledges, leasing half as many more. From all appearances and hesrsay (the only kind of information obtainable) they are doing well. Since my last visit to this district a year ago, the Pacific M. Co. (limited) have ceased operating here, and I understand are about to disiucorporate.

Bullion Shipments from Austin,

From January 14th, 1865, to July 31st, 1872, were in dollars, $9,465,524.26, aud from that date to Augnst 31st, 1873, by months, as follows, (wbich were furnished me through the politeness of G. H. W. Crockett, agent for Wells, Fargo & Oo's. Express):

1872	BARS.	WEIGHT.	VALUE.
Aug.	65	6664	$ 97,678 75
Sept.	68	6896	101,134 21
Oct.	70	6912	101,939 89

Aug.	86	8497	127,565 55

Battle Mountain Mining District.

This district is located, commencing nt a point sonth of the C. P. R. R., three miles west of Battle Mountain Station; and runs south some 25 milee by from 8 to 10 miles wide, east and west. Tnis district comprises the camps of Old Battle Mountain, Copper Cañon and Galena; the latter ie the most promising, and surrounding it are some very fine locations and developed mines. This district was first organized in the year 1866. The present Mining Recoider is Mr. N. Taylor, resident at Galena. The peculiarity of the

Mountains Comprising this District

Is very marked, there being no regular range of mountaine; the entire district, which is 25 milee long, north and south, by 12 miles east and west, forming an elliptic base, with a plateau in, or near the center; from which cañons are formed, and water runs down each nearly the whole year round in every direction. The deepest mine explored is about 300 feet deep. The ores are silver, copper nnd argentiferous lead ore of a high grade, ruby and wire silver, stetefeldtite, and a trace of gold; also regular antimony ledges. One ledge of over two feet in thickness, runs from 50 to 60 per cent, without a trace of silver.

The Town of Galena,

Around which are centered the principal minee of Battle Mountain District, is located about 14 miles south-west of Battle Mountain Station on the C. P. R. R., the point of divergence via stage from the railroad; Messrs. Tuller & Cluggage run a fine two-horse stage between the points above mentioned; fare $3; total distance from San Francisco, 536 miles; total fare $37.75. This town contains about 250 inhabitants, two hotels, and 3 or 4 mercantile establishments. About 100 miners find employment here in four or five mines, at $4 per day. The principsl ledge of this district runs north nnd sonth in close proximity to the town of Galena; dips to the west from the surface down the first one hundred feet, it then straightens and nt greater depth pitches east. It is a regular fissure vein, crossing the couutry rock, which is of the character as above described, and is traceable for a distance of some thres miles, commencing on the north of which the mines are as follows: Wilmington Tonnel, now in 200 fest, running to tap the above mentioned ledge. The next are ths mines of the

White and Shiloh S. M. Co,

Consisting of the Whits, Bsttls Mountain, and Shiloh; containing in the sggregats 4,900 feet of locstions. They are developing the ssme by two shsfts, and ons tunnel; their tunnel is in 478 ft, nnd is known as the Bsttle Mt. tunnel. Their shafts are down, No. 1., the White shaft, 134 ft. with 3 levels running north, and two south sggregating some 1,500 ft. in thsse drifts; No. 2., the Shiloh shaft, is 150 ft. deep with two levels run north and south sggregsting 500 ft. of drifts. During the courss of this development soms 1,500 tons of ore have bsen extracted, and shipped to San Francisco, that averaged some $400 per ton in silvsr, besides ths lead which averaged 35 per cent. aggregating (assay valus) $675,000 or nstting $450,000 (about 70 per cent). They havs now on their dump about 5,000 tons that will average about $50 per ton. The ore body in this mine runs from 6 to 15 ft. thick and averages 10 ft. Working regularly 25 men, superintended by S. H. Knowles, Esq. Next adjoining the above on the sonth is the

Avalanche North Extension,

Which contains 1,000 ft. in the location, and belongs to A. J. Garvey and M. MacDonald, the latter of whom is General Superintendent. The development on this mine consists of one ehaft now down 30 ft., simply run to hold the property, it showe fine mineral in this shaft assaying over $200 per ton in silver; this, like all of the above in this district, is smelting ore. Next adjoining this mine on the south is

The Avalanche Mining Co.,

One of the oldest locations of the district, and belouging to the same parties as the above. This company is made np of the following locations: the Verritas tunnel, next the Avalanche, next Veritas mine, Avalanche South Extension, Champion, Champion North Extension, and Great Eastern. The Veritas Tunnel covers the entire combination. They aggregate 8,200 ft. of locatious, covering a distance along the main ledge of 4,200 ft. Mr. M MacDonald is Superintendent of this mine. The development on this company's mines consiste of 6 vertical shafts, varying in depth from 30 to 150 feet, over one of which are erected fine

Steam Hoisting Works,

With engine of 20 horse power; they also have one incline, down 76 feet, followiug the dip of the ledge. They have cross-cut and drifted from the above ehafts an aggregate of 700 ft. The locations forming the combiuation have had some 100 tone of fine ore extracted from them, and shipped for reduction, previous to May last, when they were purchased hy the present owners, who have shipped eome 40 tons of ore themselves, assaying from $100 to $150 per ton in silver and about 46 per cent. of lead. Ore bodies have been run across during these explorations, varying in width from a few inches to some 4 ft., of an excellent character, that will run even more than that already shipped. At present, they are thoronghly opening up their mine, and when this is accomplished, they will erect reduction works of their own. At present working some 16 men, night and day. Ahout one mile south of the ahove, in what is known as Copper Cañon, and on this same ledge is located the

Battle Mountain M. Co.,

A copper mine of considerablo note. It is an English incorporation and principally owned in London; Joseph Richards, Manager. This company have several shafts down, the deepest of which is about 150 feet. They have run numerous drifts and cross-cuts, and have extracted over 3,000 tons of copper ore, and shipped the same to England, that has averaged 25 per cent. They are now working 30 white men and 12 Chinamen, and are extracting about 100 tons of shipping ore monthly.

Buena Vista M. Co.

Tbis company's ground is sitnated about 1,000 ft. west of the Avalanche mine and snpposed to be on a parallel ledge, carrying a very high grade of galena ores, assaying as high as $400 per ton. A tunnel has heen run upon this miue some 300 ft., and an incline of some 200 ft. It is owned by John Mellander and Hon. R. McBeth. At present working six men; running on the extension of this tnnnel. A considerable amount of ore hae heen shipped of a high grade. At this writing ho ore is heing extracted. Between the ahove mentioned locations and the month of the cañon, two more parallel helts exist, with a large nnmber of fine locations upon them, and more or less developed; one is known as Trinity Belt, the other a littlo farther east, is called the Bute Belt. Some five miles west of the town of Galena, is located the

Trenton Mine,

Which has been explored by four shafts from 35 to 108 feet deep, each, aud by two tunnels, aggregating 500 feet in length, and two drifts 182 feet. There have been shipped from the mine some 30 tons of ore, averaging $2.30 in silver, and ten per cent. copper. There are now 150 tons of ore on this company'e dump, valued at some $23,000. They have exposed and in sight a large amount of ore, estimated to be worth $128 per ton. This mine is at present negotiable for, and nt this writing is lying idle. Located just south of the Buena Vista is the

Ledorf Mins,

Ontsining 1,200 feet in the location. It is the property of Frank Drake and Mr. M. Monday; the development on this locstion consists of an inoline shaft snnk to a depth of 110 feet dsep. In sinking this shsft some 10 tons of very choics ore were extracted, that run from 300 to $400 per ton in silver, and from 45 to 50 per cent lead; their shaft was run down following the hanging wall, with no foot wall in sight, so the real width is not known. A tunnsl right is taken up of 3,000 feet, belonging to the same parties.

Trinity Mine.

This mins is located about three-fourths of a mile south-east of ths town of Galena, and is owned by Mr. Thos. Thompson and J. A. Blossom, Esq., of Battls Mouutsin. This location contains 1,000 feet, which runs in the same course and dips with abont the same pitch as all the above mentioned minss. It is dsveloped to a dspth of 163 feet, by a vertical shaft, has three lsvels run upon it, and two winzes, aggregating 400 feet of drifts. 200 tons of ore, of the chloride character, worked from this mine, paid from $93 to $137 per ton in silver, and abont 29 per cent lead, and 30 tons of galena ores worked from this same mine a few months siuce paid $320 per ton in silver, and about the same percentage of lead as above. It is a very promising mine, favorably located for working and drainage.

Cornucopia Mining District,

Located in Elko County, Nevada, has created some considerable excitement lately—so much so that a new route is now in contemplation, from Battle Mountain Station, on the C.P.R.R., shortening the stage travel 25 miles, lessening the time some six hours. Messrs. Tuller & Cluggage, present proprietors of the Austin & Belmont lines, are the projectors. The proposed new route from Battle Mountain will bring you to Cornucopia in 65 miles, running in a northerly direction. The fare from San Francisco to this point (Battle Mountain) is $34.25; and the stage fare will be from $14 to $16 from Battle Mountain to Cornucopia. The through fare from San Francisco to the abovenamed district is about $50, and the distauce 587 miles; *via* Elko it is ahont 100 miles further, and costs about $7 more for fare.

L. P. Mo.

The Proposed Bear River Flume and Tunnel.

EDITORS PRESS:—Your correspondent, "W.," in his strictures on the above enterpise, published in a late issne of your journal, is mistaken in supposing that the flume to be laid down along the bed of Bear river must necessarily have the eame fall as that within the tunnel, and that a grade of less than three inches will he insufficient to carry off the tailings, as well as iu his assumption that, if this stream had ordinary sluice-grade, these tailings would never have accumulated along it to the extent they have done. Now, Benr river, along the portion of it which it is proposed to flume, has a fall of abont 90 fest to the mile, or, ssy 2½ inches in 12 feet, a grade ample to the removal of tailings of the chsracter here to be dealt with, consisting, as they do, mostly of sand, pebbles or fine gravel, nnd wholly free from large houlders. In but few hydraulic mines in the State do we find a steeper grade than this, while in many localities operations have been extensively and successfully carried on with only ahont one-half of this grade. The La Porte Flums, 4 feet in width, carries off the gravel from the mines of Garb & Orr, with n fall of ouly 1¼ inch to the rod. At Ohio Flat, Yuba Co., aud New York Flat, Butte Co., where a heavy bed of barren earth is run off, the gravel paying only on the bed-rock, they keep their flumee clear with a deecent of one inch to the rod, which is about the average fall on Willow creek, near Camptonville, and also along the Slnte creek in Sierra county, where immense hydraulio operations have been carried on for many years. About Quaker Kill, Red Dog nnd You Bet; along Deer creek, Shirt Tail and Indian cañons, and at many other points in Placer and Nevada counties, hydraulic washing has been prosecuted for nearly twenty years with less than an average three-inch grade, the amount of water to he had at the several places being less than one quarter the quantity available for the purpose in Bsar river. It will not, therefore, become necessary for this company to elevate their flume to the hight of 1,500 or even 400 feet above the bed-rock, ss feared hy your correspondent, "W.," in order to run the tailings out of Bear River and its upper tributaries.

The reason that a greater fall has been given to the projected tunnel, and consequently to the flume within it, than to the structure laid along the river above, is, that the passage here being compratively narrow, a greater descent was required to impart to the water and gravel snch velocity as would prevent any material lodging along it, or its ever becoming choked up, there being abundant room for fall, nnd it not being intended to place any gold saving appliances within it. The conclusion that these tailings, because that they have made lodgment aloug the bed of Bear River with its natnral inequalities of surface, and with the water spread ont iu a thin sheet over two or three hundred feet, cannot therefore be carried off in a sluice with the current confined to a narrow channel, is so obviously fallscions as to reqnirs no notics.

Your corrspondent sskslfor the data on which it is estimsted that 400 tons of quicksilver have bsen dsposited in Bsar River and its confinents. As an authority for this statement we have the results of numerons carefol examinations made with a visw to determining the probable quantity of this metsl lodged here and the product gathered from a considerable smount of sluice washing done at differsnt points along the streams, backed by the concurrent tsstimony of the miners who have been at work here for so msny years, and the most of whom cousidsr this estimats an extremsly low ons.

In rsgsrd to the value of smslgam, while it is trne, as "W." obsarves, that it is worth about $8 per ounce when the quicksilver has bsen kept in contact with the gold until it has becoms charged to its fullest capacity, it may again possss less than a tenth of that valus, whsrs, as has been ths cass aloug these streams, it bas been hastily run from the sluices and afterwards beeu mixed up with n vast quautity of sand and gravel.

Whether it would be better for capitalists to invest their money in opening up the deep placers, as asserted by your correspondent, than to embark a portion of it in an enterprise like the one nnder consideration, is, of course, a question about which practical miners may honestly differ in opinion. TAIL SLUICE.

Bear River, Placer Co., Oct. 16, 1873.

Mine Swindlers.

EDITORS PRESS.—Recently some English capitaliste have been communicating with me in order to ascertain my opinion of the propriety of investing in the western mines of the U. S., especially those of Utah, but are skeptical on account of having heard of the many swindles, law euits, etc., perpetrated by a class of vain-glorious thieves, upon several honorable companies, especially English. Notwithstanding, they have at the same time a strong desire to purchase and develop some mineral property which they may deem preferable. My response to each has bsen: Be cautions and do not think of investing until some one visits the location, whose experience cannot be warped hy prejodice, and whose honesty is irreproachable. Many nefarious scoundrels strut about swollen with falsehood, waiting the arrival of a stranger, not only for the capitalist, but even for the poor honest miner whose sole dependence is the mines. There is scarcely a miner in the West who has been fortunate enough to escape their smooth tongue and lying lips. Such beings are known nnd abhorred hy the honest resident; but the foreigner is open to the snare. Each and all of these people deserve expulsion from every mining community such individuals are the greatest drawbacks and the worst enemies that can possibly enter a mining region. The "tin" excitement at Ogden, Utah, was nothing but the failure of a large contemplated swindle. At the start of it, a friend of mine presented me eome of the specimens of "tin," to whom I replied: There'e not a particle of tin in it. Furthermore, another friend of mine was offered a certain sum of money for a stone of tin weighing three ounces that he bronght from Cornwall, which if purchased was to have been used for the promotion of their nefarious scheme. The Welsh & Co., "jumping" a portion of the Wellington Mine; the Illinois Tunnel business; the Left Bower Mine, etc., what were they but projected swindlss? Every good, or prospective good mine has heen moleeted by jumpers, (thieves), and with credit may it be eaid, that the MINING AND SCIENTIFIC PRESS has continually reminded the capitalists and miners to he cautious. The mines of the West are very nnmermerous and unsurpassed for riches; then why should well-meaning gentlemen be trifled with? Why cannot the mines of the West he bought, wrought and disposed of honestly like those iu other countries? The foreigner who visits the Pacific Slope, generally goes in all truth and honesty, and hopes to find the same kind of geutlemen in the West; hut alas, truth bids us remark, many are found otherwise, yot this could possibly be ohviated by puhlio exposure. T. S.

The Proposed Bear River Tunnel.

EDITORS PRES:—I have no desire to trespass upon your columns in the discussion of the merits or demerits of the proposed enterprise. In my commuuication of September 27th, I showed the praotical effect and result of the figures given in the PRESS of August 30, without expressing an opinion one way or the other as to the real merit of the enterpriss. A correepondent from Little York, eiguing his communication "M." saye I did not state the "plan" correctly and asserts that four inches to twelve feet is all the flume in Benr River will require to work the tailings successfnlly. This is one inch more than the miuimum I gave, and is probably enongh grade for a flume of that size. Bear River must have a fall of 146½ feet to the mile, in order to keep a flume on bed rock on four inch grade to twelve feet. Now it is a well knowu fact that Besr River has no such fall for several miles above Colfax. Let "M." give the report of a respectable engineer and he will help his case if he be correct in his "disinterested" statement. W.

Oakland, Oct. 17, 1873.

SCIENTIFIC PROGRESS.

The Fossil Man of Mentone.

The discovery of a human skeleton in one of the grottoes of Mentone, a village on the south coast of France, near Nice, has produced for some time past no small excitement in the scientific world. The cave in which it reposed is hollowed in the garumnian limestone immediately below the nummulitic tertiary deposit so well developed in the vicinity. Some large imbedded rocks, probably post-eocene, gave rise to the natural excavation.

It appears, from the recent investigation of M. Riviere, that, at the upper portions of the caverns examined, remains of instruments and tools were found, belonging to the prehistoric epoch which immediately preceded, in the west of Europe, the appearance of metals. Below the surface, beds abound, remains of human industry indicating a civilization even more primitive than the antiquity assigned them by the superposed masses. In this locality was discovered, at a depth of 21 feet, the famous human skeleton. The earth was evidently in virgin condition, and hence the remains clearly belonging to the geological and palæontological age of its surrounding deposit. While, however, the fauna discovered in connection with the human relics indicate a very ancient palæontological epoch, the bone and stone instruments, and especially the necklace found on the skeleton, seem to point to a more recent period. The presence of cave bears and hyenas, the *rhinoceros tichorinus*, and *bos primogenius*, evidently relate to the most ancient quarternary epoch, the age of the bear; while, on the other hand, the abundance of remains of deer of various species and of small hight (chamois especially), the fact of the multiplicity of bone tools, needles, chisels, and a *baton* of command, together with the peculiar necklace which closely resembles that found on the fossil man Cra-Mango, lead to the conclusion that the series of objects belongs to an age posterior to that of the bear, namely, to that of the reindeer. It is believed, however, says Dr. Garrigon, in *La Nature*, that the original owner of the skeleton existed during the latter age, and was buried in a cave formerly inhabited by men of the preceding epoch.

New Experiments with the Electric Current.

MM. P. and A. Thénard communicate to *Les Mondes* the following conclusions derived from recent electrical researchss:

1. That vapor of water does not hinder the production of the current, which decomposes it into its constituent gases. 2. The current, while determining the combinations of nitrogen and hydrogen, decomposes equally ammoniacal gas; but, in both cases and without absorbent bodies, there is found in the gaseous mixtures a quantity of ammonia quite feeble, but sensibly equal. 3. Nitrogen, under the influence of the spark and the vapor of water, disappears to produce an undetermined body which is believed to be nitrite of ammonia. 4. Gaseous phosphoret of hydrogen is similarly incompletely decomposed by the current, and this decomposition is accompanied with phenomena which prove first, the formation of liquid phosphorus, then solid phosphorus, and, lastly, a body supposed to be the same substance in its amorphous state. 5. The current acting on a mixture of gaseous phosphorus of hydrogen and bicarburet of hydrogen reproduces one at least of the phosphoric akalies. 6. Under its influence, the bicarburet of hydrogen alone condenses rapidly into an odorous liquid, soluble in ether, but insoluble in water. 7. On the other hand, the monohydrate of methylene is transformed in presence of water into marsh gas, into pure hydrogen, into a powerful acid soluble in water, and into a resinous body differing from the viscous substance furnished by the bicarburet.

. SINGULAR EFFECT OF COLD.—A German experimentor, Herr Harvath, in studying the physical effect of cold on frogs, claims to have made the singular discovery that the immersion of the human finger in alcohol at a temperature of 25° Fahr. renders the finger insensible to pain, but not insensible to contact with other bodies. He also claims to have discovered that upon immersing wounds and burns in cold alcohol the pain immediately ceased; this effect being very remarkable in the case of burns, the subsequent progress of recovery being greatly accelerated by this means.

With regard to the accuracy of the statement that tactile sense remains after insensibility to pain has been produced, we have some doubts. It will require very close observation and analysis to establish this fact, as the sense of touch might be communicated to the nerves through the parts rendered insensible by the contract of the anæsthetic.

IN 1867 M. Rabuteau announced that the poisonous power of the metals was greater as their atomic weights were higher and their specific heats lower. He now shows that the atomic weights of calcium and potassium being nearly the same, the toxic effects produced by injecting similar solutions of their salts into the blood are also the same, both acting as poisons to the muscles and causing death by arrest of the action of the heart when administered in sufficient dose.

Peat.

The treatment of peat, and its preparation and adaptation as fuel in an improved form upon its natural state, receives intermittent attention, and we notice three different proposals for processes in development thereof. Two of these relate to the manufacture of fuel from peat, *pur et simple*, and the third to an admixture thereof with other combustible material. Mr. John Fawcett, of Kirton, in Lindsey, Lincolnshire, claims improvements in the treatment of peat as taken from the bog, by effecting the extraction of all excess of moisture, by submitting it to the action of a hydro-extractor; the dried peat being subsequently reduced to a granulated condition, and then compressed into suitable blocks. Captain W. J. Engledue, R. E., of Tavistock, Devonshire, projects improvements in the method of drying manufactured or other peat and artificial fuel, which is to be effected by means of steam or hot-water pipes. He makes a drying shed of special construction, the floor being formed of pipes of iron or metal placed close together, or otherwise, with steam or hot water circulating through the same. On this floor the substances for desiccation are deposited in a moist or liquid state; or they may previously have been dried partially by exposure to atmospheric influences. This apparatus and procedure are applicable also to the desiccation of kaolin or china-clay and similar substances. Mr. Thomas Cadett, of Rosherville, Kent, proposes the composition of an improved artificial fuel, by combining bog peat or turf with oil, or with tar, pitch, resin, asphalte, or with other resinous, bituminous or oleaginous substances. The process consists in first drying the peat or turf by artificial heat or simple exposure, and then immersing it in some one or other of the substances above enumerated. It is then submitted to pressure in moulds, not only to impregnate it thoroughly with the substance used, but also to express any superfluity; and it is subsequently prepared for use by a second drying process. There can be no question about the extent of the industrial resources comprised in the peat bogs of this and other countries, and the problem of their perfect realization is one of great importance, but, on the whole, we are inclined to regard it as yet awaiting solution. These fuel resources are locked up, but we have not yet got the exact key.

WE are indebted to the insect tribe for the invention of chloroform. The ant contains a substance about which old John Ray and Martin Lester corresponded a century ago; and they found that it contained an acid, and this was afterwards called formic acid. It was found to be composed of a compound radical formyle and three atoms of oxygen. Dumas substituted chlorin for the oxygen, and thus obtained ter-chlorid of formyle, which is chloroform. Then it was found that ether was capable of taking away all sensations of the human body, and Dr. Simpson of Edinburg found that ter-chlorid of formyle was better adapted for this purpose than ether. The formula for chloroform indicating its correct chemical composition i C^2 H Cl_3

USE OF MOLASSES AS A FERTILIZER. — The beet-sugar molasses has been ordinarily used for the manufacture of alcohol by distilling it, but of late the tax on alcohol has been made so high that it scarcely will pay to treat the molasses in that way, and it is proposed to use it as a fertilizer. One manufacturer feeds it to his live stock. The composition of 100 kilos. of molasses at 41.13 is given by M. Vivien as follows: Moisture, 27.20; Sugars, 47.72; Potassa, 4.72; Ash, and various acids, 6.71; Organic matters, 13.65; Nitrogen, 0.94. To render it more easy of transportation, and application it is proposed to mix it with slaked lime in the proportion of two of molasses to one of lime.

NEW REDUCING AGENT.— If water saturated with sulphuric acid gas is allowed to act upon zinc-powder, the metal dissolves without the emission of gas, and the liquid becomes of a pale yellow color, and possesses, in a high degree, the power of decolorizing indigo. Schützenberger has lately been investigating this subject, and finds that this decolorization is the result of reduction. The liquid above mentioned, in its free condition is extremely unstable; but if a concentrated solution of bisulphite of soda is allowed to act upon the zinc powder, a soda salt of the new acid is obtained, which possesses reducing powers no less remarkable than those of the free acid itself.

THE application of the bromides in medicine has within late years increased to an enormous extent, the bromide of potassium alone being manufactured by tons and furnished at a low price, whereas years ago it was only the more wealthy who could afford to use it. The combinations of bromide usually employed are those of potassium, sodium and ammonium, and their virtues depend principally upon the extent to which the bromide is taken into the system. This substance can not be employed by itself on account of its very acrid properties.

CONGEALED DYNAMITE.— Nitroglycerine, according to L. Roux, freezes at 7° or 8°, but dynamites well prepared maintain their plasticity at 0° and even below. Once congealed the plasticity returns very slowly, but whether congealed or not they seem to be more and no less dangerous in the one condition than in the other.

MECHANICAL PROGRESS.

The Art of Inventing.

Many persons suppose that the capability of inventing is wholly a natural gift, but such is not the case. It is just as much an acquired art as any other profession. In order to insure success as an inventor, it is necessary for the student to go through a school of inventive studies and to confine his productions to a particular class. If a mechanical inventor, he must understand mechanical movements and powers, as well as metals and timber and how to work them. He must study the relation between causes and results, he must acquire a knowledge of drafting, and must learn what has been accomplished in his particular line.

It is true that some wonderful inventions have been made by persons entirely unacquainted with the particular branch in which they were working, but such instances are rare. The more extended the knowledge which the artisan possesses, the more likely is he to make a valuable improvement. But constant and unceasing study is entirely unnecessary; in fact it tires out the mind, which, like the fatigued body, must have rest before it can successfully pursue its laborious journey. If, therefore, the mind becomes weary and confused, it is better to drop the subject for a time and take it up again.

Nearly twenty years ago, in the city of Boston, a friend of ours, still living, invited us to accompany him to see a model of an invention. We went with him, and a very enthusiastic young man showed us a beautifully made model, mostly of finished brass, of a ship with a revolving mast geared into the paddle wheels in order to propel his ship against the wind. He said that he took the idea from a feed mill, run by wind, near Charlestown bridge. "But," said our friend, "that feed mill is on *terra firma*; but where will your ship be going when afloat? With the wind blowing against the revolving sails, you will have to cast anchor in order to keep it from blowing backwards." He had never studied cause and effect; and he told us that he had spent six months and nearly $2,000 in trying to accomplish an impossibility. Years of precious time and thousands of dollars are annually lost in a similar manner. Many hundreds of men have labored at models and expected to make fortunes by running an overshot or breast wheel in a dead pond by causing it to pump up its own water, and by similar impossibilities.

The educated inventor will never run into such wild cat schemes. But as he becomes more and more acquainted with the arts and sciences, he will find that every step forward must be directed to a practical result; and at last when his life's work is done, he will see that all he has gathered will be only a drop from the ocean of Science, which lies still spread before mankind for other minds than his to continue to explore.—*Scientific American.*

TEMPERING STEEL. — Since, in tempering steel, the colors owe their appearance to the formation of an exceedingly thin superficial skin of oxide, it is evident that the steel, when withdrawn from the fire, does not retain its first color, but there appear other colors in consequence of a subsequent oxidation by the air, until the steel is sufficiently cool. Of a certain color, one can only judge with certainty by examining the conditions under which it occurs. If two pieces of steel are heated until the yellow color appears, and if one is withdrawn, it may become in the air purple, violet, and finally blue, while the other piece assumes the same colors in the fire. However, if both pieces when blue are dipped into water, they assume different degrees of hardness, *i.e.*, the one which turned blue in the air will be harder than the one left in the fire. Hence it follows that proper caution must be observed in this respect, and steel must either be cooled rapidly, when the right color appears in the fire, or it must be withdrawn at a preceding color, if the color is to appear by after annealing. Sometimes it is intended by the process of annealing to give to articles an attractive appearance, and at the same time to prevent them from rusting by the formation of a layer of oxide. In such a case, uniform quality and heating is required.

A WONDERFUL MODEL.—An elaborate model of a harbor ordered by the Senate of Hamburg to be constructed for the Vienna Exhibition has been completed in due course. The model is 17 ft. by 6 ft. in dimensions, and it exhibits the ships moored to the wharves, and the laborers employed on their different occupations. On the side of the dock is a railway with a freight train to receive goods from the ships. The vessels are of all sizes from the huge steamer down to the smallest yawl. The whole represents with pleasing accuracy the busy life of a sea-port.

NEW METHOD FOR PREPARING ALUMINUM.— This consists in mixing charcoal and clay or kaolin together to a red heat; then introducing chlorine gas and by this means subliming off a quite pure aluminic chloride which may be decomposed by a battery.

A Beautiful Industrial Art.

One of the most beautiful productions for which Birmingham has long been celebrated, and to rival which other parties have always unsuccessfully put forth their endeavors, is the japanned ware—baths of all sorts, trays, pails, toilet-sets, and a great variety of other articles known and admired in every part of the world. According to an account now given of some of the processes which pertain to this manufacture in that place, the iron, on being formed into the required shape and size, is rubbed with a peculiar kind of stone until it becomes smooth; it is then handed to a woman, who lays on one or two thick coats of color mixed with varnish, and places the tray in a stove to dry; after which it is varnished three or four times, and again thoroughly dried; then rubbed, smoothed and polished, and prepared to be handed to the printers' room, where it is ornamented according to the design intended.

This last-named operation appears to be decidedly unique and ingenious. The design is engraved upon a copper plate, and the impression is taken by rubbing into the cavities of the engraving an oily composition, which adheres, in the form of the design, to the paper pressed upon it. The printed paper is laid upon the tray and rubbed with flannel, so that the oily substance adheres to it. The paper is now lifted off, and gold, silver and bronze dust plentifully scattered upon the mixture as it stands in the tray. This is rubbed with flannel, and all the details of the design are thus brought out, and as accurately transferred as if the tray itself had been subjected to the ordinary process of printing from the copper plate. The colors are then made fast by varnishing and drying, smoothed by rubbing with rottenstone, and finally polished with the naked hand.

It is stated that the females employed in polishing the best goods never engage in the regular household duties, such as scouring the floor, or even handling the broom, lest their hands should lose the soft touch so necessary to give the last beautiful touch these attractive articles. —*The Cabinet Maker.*

CHEAP DOMESTIC MOTORS. — Through the efforts of M. Fontaine and others, this subject of cheap domestic motors continues to attract a great deal of attention in France. Fontaine's gas engine, of one-man power, has received the gold medal at the Lyons exposition, and a silver medal was given to the constructors; but the general introduction of this motor is checked by legal prohibitions. The type of engine worked out by M. Fontaine has neither safety valve, gange cocks, nor water gange; and the administration, consulting old ordinances, imposes the necessity of providing his engine with all the accessories and surety apparatus generally employed. These complications greatly increase the cost of the machine, and restrict the number of its applications. M. Fontaine observes, however, that his domestic motor constitutes, in spite of this inconvenience, the most advantageous solution of the question, as well from the consideration of first cost as from cost of maintainance. He compares this engine to electric, hydraulic, and spring motors, and proves the advantages of simplicity and economy which the Fontaine engine possesses over all others. Calculations made by the inventor estimate the daily cost of gas, for a one man engine, from 1·12 franc to 1·35 franc, according to the price of gas.— *Iron Age.*

REWARD OFFERED FOR SELF-ACTING COUPLINGS.—The Union of German Railroad Administrations has determined to award prizes —one of 3,000 thalers ($2,250), another of 1,000 thalers ($750)—for the invention of a contrivance by means of which coupling of railroad cars can be effected without the necessity of stepping between the cars. The invention submitted for competition must have been tried practically by one of the railroads belonging to the Union previous to the sending in of papers, and the proposition for the reward of the prize must emanate and be supported by one of the said railroads, The premium does not debar the inventor from patenting the invention and enjoying the benefit of the patent. The papers must so explain the invention by illustrations, drawings, models, etc., that an opinion can be easily formed of its quality, practicability and working; and must be sent in, carriage paid, to the head office of the confederation, Berlin, Prussia, before the 1st of July, 1874. The examination of the competing plans, as well as the decision, whether general or in the form of an award of prizes, will be undertaken and decided by an examining committee, consisting of twelve members, appointed by the confederation.

THE MANUFACTURE OF JUTE.—Jute is principally manufactured at Dundee, Scotland, where there are fifty-nine mills, ranging from four to eight stories high. The largest mill employs 5,000 hands, and works up into fabrics 999,000 pounds of raw jute per week. The weekly wages paid are from $5 to $10 for men, and $2.50 to $7 for women. The principal consumers of burlaps or jute cloth in the United States are Californians, who use them for grain bags. Ten per cent. of the value of the California wheat crop is expended in the purchase of coarse jute, cotton and linen bags. The duty is thirty per cent. on jute cloth, and forty per cent. on jute bags. In view of these facts, the *American Manufacturer* suggests that we should manufacture jute bags ourselves; otherwise we must continue paying the "juty" of forty per cent.

Our Weekly Stock Review.

THURSDAY EVENING, Oct. 23d, 1873.

Stocks this week have been unusually strong as compared with the hed-rock prices ruling a few weeks since. The Comstocks have been the rage during the past few days, with Consolidated Virginia as the favorite. The movements of this mine have been the puzzle of the street. Two weeks ago $100, the figure steadily maintained for some time previous, was left far behind by advances day after day, which brought the stock to $140, $170, $200, and finally $270, as through so many stations. The split of five to one, made in the capital stock of this company, has increased the number of shares from 23,600 to 108,000. Prices were correspondingly reduced. The two Centrals, Central proper and Ceutral No. 2, sympathized with their adjacent neighbor, Con. Virginia, and touched $16 and $12 respectively, a gain of $4 and $6 upon last weeka' highest quotations. Other Comstock mines have come into favor also. Best & Belcher, Savage and Utah, have advanced $1 each; Ophir, $7; Overman, $6 50; Seg. Belcher, $5, and Sierra Nevada, $2 25. Only the low priced Washoe mines have fallen any, and these but slightly.

In the rush for the Comstocks, other Nevada stocks naturally were neglected, and most fell off slightly. Raymond & Ely, in prospect of the suit with the Kentucky, remains stationery, while Keutucky, which has all to gain and little to lose, does not appear to he appreciated as a good "gamble."

The capital of Goldeu Chariot has been increased from $1,000,000 iu 10,000 shares to $3,000,000 in 30,000 shares. It is proposed, it is said, to give the Minnesota shareholders 5,000 shares of the new stock for their mine. If this offer is accepted, the latter company will be dis-incorporated.

Sales of prominent stocks this morning are reported as follows: Belcher, $68; Crowu Point, $108; Chollar, $45; Con. Virginia, (new issue), $55; Caledonia, $17; Ophir, $64.50; Overman, $17.25; Savage, $43; Seg. Belcher, $53, and Yellow Jacket, $58.50.

The sales of stock at the San Francisco Stock Board for the week ending yesterday, amouuted to $2,493,000; Kentuck and Belmont show the largest number of shares sold, the movement in the former being half the capital stock, 11,700 shares; of the latter 10,400 shares changed hands; 8,900 shares of Baltimore Con.; 8,500 shares of Overman; 6,650 shares of Ophir; 5,600 shares of Justice; 4,700 shares of Imperial, and 4,300 shares of Julia were sold. The large numbers of shares changing hands and the marked increase in value of some of these stocks, prove the assertion so often made, that mining stocks have touched bottom and that the recent dullness and prostration is virtually over. We may look for startling flights soon from some of the stocks, from speculation if not on more solid grounds.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

AMADOR CANAL.—Amador *Dispatch*, Octoher 18. We are gratified to be able to announce that work has at last been resumed ou the great Amador canal in good earnest, and that it will certainly be complcted about the middle of the present wiuter—probahly about the middle of January. There are only about nine miles yet to be completed, and the new company have already commenced work on the lower end, and have let out a contract for finishing five miles on the upper end to some parties, who are now engaged in erecting sheds for their workmen, and will commence work on that end of the ditch on next Monday. We are assured that the new company have ample means to finish the work, and have determined to put it through as soon as possible. We understand that the parties who have tsken the contract on the upper end contemplate finishing their contract by the middle of Decemher.

The recent rich strike in the Alpine mine at Plymouth, Amador county, is turning out much better than was at first expected. The ledge is some 3 ft. in thickness, with a solid granite wall—a sure indication of permauency. The rock will pay $100 per ton.

ALPINE COUNTY.

OUR MINES—Alpine *Miner*, October 11: Judge Blair, of Reno, visited Monitor this week, and expresses his belief that we have one of the richest mineral deposits on the coast. This is the universal opinion of experienced miners, and every development that is now being made proves their theory to he correct.

I. X. L.—From Silver Mountain we learn that Mr. Chalmera has a full force at work upon the Exchequer and I. X. L. getting out ore, and that he hopes to make another run hefore winter closes in. The indications in the mines are good, but it has become necessary to increase the steam power for clearing the shaft of water. For this purpose a boiler of larger capacity than the one formerly in use is now being put up.

THE SCHENECTADY MILL has not been running the past week, Superintendent Hunter having been below to see about some necessary repairs. The minera are sending some rich looking rock to the ore house.

THE MI. & N. W. dam is undergoing some repairs, and the Silver Glance shaft is receiving timbers, preparatory to starting the hoisting worka aud again commencing the downward movement. Every now and then rich specimena of ore are brought out hy the miners from the shaft, and quartz with rich sulphurets from the face of the weat drift.

RESUMED WORK.—After "a rest" of ahout ten years, work has this week beeu resumed on the Silver Cloud claim, near Silver Mountain. We learn that it is the intention of the Compauy to have a few tons of their ore worked at one of our minea.

CALAVERAS COUNTY.

GWIN MINE.—Calaveras *Chronicle*, October 18. The little disturbance among a portion of the hands employed in the Gwin mine that interrupted operations for a few hours, Monday last, has been quieted, and work ia being energetically pressed in the levels and shaft. Good

rock is coming in from the 700-ft. level, and the ledge is rapidly increasing in thickness as the shaft goes down. Experienced hands, men who have worked in the mine for a number of years, tell us that the indications are almost positive that before the sinking of the one hundred feet below the 700-ft. level is completed, the ledge will show wider and richer than at any other point where it has been uncovered. We also learn from good authority that the end of the "break" in the 700-ft. level has been reached, and that the ledge is coming in handsomely. No one at all acquainted with the history and characteristics of the lode upon which the Gwin mine is located is surprised at a "break" at the depth of between six and seven hundred feet. It has occurred wherever a shaft has been sunk upon the ledge. Those connected with the mine, from the proprietors down to the humblest employé, never had greater faith in its assured success than at present. Mr. James Gleason, of our town, a man of indomitable energy and push, and a thoroughly practical miner, has been appointed Superintendent of the mine and is now directing operations.

WEST POINT DISTRICT.—The Atlantic, a mine but little known, realized $3,243 last week, the yield of 16 tons and 300 pounds of ore, or at the rate of $153.33 per ton. The Atlantic, Stevenson & Co. and Last Chance are on the same vein, including some 2,000 linear feet. The last ore taken from the Last Chance yielded at the rate of $119 per ton. Stevenson & Co have ore on dump worth about $60 per ton.....Good ore has been struck in the main shaft of the Ohio Consolidated; new hoisting works are in course of construction .....The Harris mill has been running on Bartolo ore.....The main shaft of the Good Faith is down 70 feet, with fine walls nearly 8 feet apart. Ten feet deeper will bottom the old works.....O. Mentzel & Co. are taking out rich honey-comb ore, some 150 yards southwest of the Good Faith.....F. Williams & Co. are stoping in their mine near the Atlantic .....Joe Griggs & Co.'s tunnel is within a few feet of the nearest of their veins, which formerly yielded well but were abandoned on account of water.....The Henry tunnel is being extended without interruption.....The Harris mine, at the Butcher ranch, continues to yield fine milling ore, improving as developments are extended.....The Lone Star has temporarily suspended work.....Zacatero sinking.

FRESNO COUNTY.

STARTED UP.—Fresno *Expositor*, Oct. 11: From Wm. Berry, Esq., of Panoche Valley, we learn that the Flint Quicksilver Mining Company, whose mine is situated about three miles south of the valley, has started a large number of men at work about the mine, making furnaces, roads, houses and other necessary improvements, preparatory to commencing to extract quicksilver from the ore. The mine has been sufficiently developed to satisfy its owners that it is extensive and good. The work is being pushed forward with great energy, and it will not be a great while before a stream of quicksilver will be pouring into the market from that quarter. Over forty workmen are now employed, and others will be put at work as soon as they can be obtained.

INYO COUNTY.

SYLVANIA DISTRICT.—Inyo *Independent*, Oct. 11: Sylvania district, of which we last week promised an account, was organized June 14th, 1873. It is situated 12 miles southeast of Piper's ranch, Fish Lake valley, and about 15 miles west of Lida mining district. It is easy of access, and has fine facilities for reduction works, wood and water, two very important items, being plentiful. The State line run by Von Schmidt cuts the district through the center, leaving the mines pretty equally divided between the two States, but the reduction works, and consequently the principal business place, will be in Inyo county. The ores are principally smelting, and are found in fissures in a quartzite belt with lime outcroppings interspersed, traceable for several miles. There are, besides, quite a number of rich silver locations. The chief smelting mines are the Liberal, Gladiator, the two Emmas, Transit, Eugenie, Mountain View, Last Chance and the Metallic, with a number of later discoveries further south but on the same belt. Prospecting is going on with a vim, and the district is happily blessed with the right sort of miners, who are determined to see that their ledges have *depth* to them—sufficient to satisfy the most exacting of mining experts, and the ledges have almost universally presented at the bottom of the 40, 60 and 80 foot shafts a better appearance than on top. The owners of some of the most important developments are Shaw & Manser, Halsey & Hubbard, Morati & Bersy and W. F. Kincaid. Scott & Fitzgerald of Lida have recently purchased a valuable interest in the district.

THE ECLIPSE.—There are prospects that Capt. Endey, of whom we spoke a week or two since, will make a systematic effort in London toward the re-inauguration of operations on the Eclipse. The mine in question is a mammoth ledge of low grade gold ore, and in our belief there is no question but what it can be made to pay, and largely, too, by placing it in the hands of an honest, competent and judicious manager.

KERN COUNTY.

LIME.—Havilah *Miner*, Oct. 18: Mr. James Grant, of South Fork, has discovered a fine mine of lime and will soon commence getting it out, when he will be able to supply the market.

IMMENSE BLAST.—Sucker Flat, Oct. 11: At six o'clock this evening, a blast of 300 kegs of black powder was exploded in the Pacntolas claim doing great execution.

MARIPOSA COUNTY.

MINING PROSPECTS IN THE COULTRILLE DISTRICT.—Mariposa *Gazette*, Oct. 17: Reports from the North side of the Merced river represent the quartz mining interest of that section as decidedly improving in prospect. On the North Fork last Friday a rich strike was made in the Banderita mine. The ore is said to be fully equal to any ever taken out of that locality. The mine was formerly owned by the Goodwin Brothers, and was very valuable. The company now feel confident that they have one of the richest lodes in this section of the State. Flannagan and Keyes have a very good prospect on an extension of the Hasloe mine, and indications are favorable for a resumption of specie payments all along that line.

THE BEAR VALLEY MINE.—The discovery of a rich quartz vein near Bear Valley, the report of which we published two or three weeks ago, is likely to prove of some importance. The prospect is said to be good for a permanent and valuable mine. A road from the mine to the Benton Mill is in process of construction. Forty Chinamen are now engaged at this work.

RICH STRIKE.—The Mariposa Land and Mining Co. have recently cleaned up the result of the crushing of 16 tons of rock which yielded exceeding $25.00 per ton. This rock which was crushed at the Bentou Mills was to test a vein which had long been known, but had never been tested to any practical purpose. The vein is situated on the right hand side of the back-bone road to the river and is about midway between the Pine Tree mine and the mills or 3,000 feet from the mouth of the river tunnel. The vein matter is 5 feet thick and all its contents from wall to wall were crushed without selection. It consisted of the cropping and surface rock. It is rumored on good authority that some of the casing rock will assay 50 cents per pound. The vein is difficult of access for the purpose of transportation, but if the result is equal to the promise, a good road to the mine will cost but a nominal sum.

RICH STRIKE NEAR HORNITOS.—A party of Mexicans, who have been working in the Jerome Brown mine, near Hornitos, struck a rich pocket a few days since and took out over 100 ounces of gold.

STILL ANOTHER.—Mr. James Harlow, while prospecting near French Gulch, on the head waters of the Fresno, struck a rich prospecting vein. The gold is coarse, and several very fine specimens have already been taken from it. This is considered by old miners to be the vein that has supplied the adjacent gulches with the rich, heavy deposits found in other years.

NEVADA COUNTY.

MAGENTA MINE.—Grass Valley *Union*, Oct 15: The Magenta mine some weeks ago struck a rich ledge in the shaft, the rock of which ledge would pay, as estimated by good judges, all the way from $60 to $100 per ton. On Monday last another ledge was struck in the shaft. This second ledge is about two feet in thickness, which is larger than the upper one. The new found ledge shows rich in free gold and has plenty of galena all through it. The Magenta folks are jubilant, and Mr. Superintendent King wears a smiling face.

MINING AT LOWELL HILL.—Nevada *Transcript* Oct. 15: Quite an excitement was recently created in that section, by the report that the Swamp Angel Company had struck a back pay channel in their claims, obtaining very rich prospects. The strike was made in running their main tunnel; but as a new lead has been struck, deeper than the one they were working, the company have gone back and commenced blasting and cutting the tunnel down to a sufficient depth to work the new channel to the bottom. They have 226 feet of tunnel to cut down, and by January 1st, 1874, will have it completed. A full force of hands are employed, day and night, in driving the tunnel; the Swamp Angel Company had a clean up the other day, for the month of September, which averaged $12 per day to the hand. An application for a patent to the ground has been made. "Back pay" is the order of the day at Lowell Hill, and all the claims on the line of the Swamp Angel are running bed rock tunnels for the new channel.

J. HILL & Co. are "pushing things" as fast as they can, night and day, with giant powder and muscle. They have only sixty feet further to go.

THE East New York and Wild Cat Companies are making arrangements to start up their claims this Winter.

BED ROCK.—Skehan is driving a bed rock tunnel in his claims, and expects to strike the pay gravel in about two weeks.

THE PROVIDENCE MINE.—This mine is becoming celebrated, not only for the immense size of the ledge, but also the richness of the rock. Within the past few months the mine has increased in value to such an extent, owing to the richness of the quartz and the mammoth size of the ledge, (being forty feet thick) that it was rumored on the street the other day that one million of dollars had been offered for the Providence and refused. The last clean up, made a week or ten days ago, although not generally known what the exact amount was, must have been "big," as we were informed on good authority, that it was "four times as much as they expected," judging of course from the previous clean up, which was very good.

LOCAL ITEMS.—Grass Valley *Union*, Oct. 19: Grass Valley District has materially improved within the past month as regards the mining situation. Prospecting is active and most of the prospectors have good reasons to rejoice in their success. The Idaho mine has been running steadily all through the month with good results. About $80,000 for the last four weeks is the result. The Eureka mine has run steadily for the last four weeks. The product has been about $27,000. Another small vein of rich ore has recently been struck in the New York mine. The Empire mine yielded $15,000 in September. The new shaft in the North Star is down 400 feet, and has a ledge which yields $32 per ton ore. The yield of September was $20,000. The ledge in the bottom of the shaft of the Kentucky mine shows rich rock with free gold and heavy sulphurets. Copper ore is being taken out of the Well lode near Spenceville. A new shaft has been put down a distance of 150 feet, and in the bottom the ledge is 70 feet wide. The ores work 11 per cent. of copper, and it takes 3 per cent. to pay expenses. At the Zinc House some fine gold bearing quartz has been taken out. The rock of the Magenta mine mills from $60 to $100 per ton. The Omaha continues to show a rich and large ledge in the shaft and in the drifts.

THE prospects are that the Ooe mine will resume operations on or about the first of November. The mine is a good one, but the San Francisco part of the arrangement seems to be tardily managed.

PLUMAS COUNTY.

CRUSHING.—Plumas *National*, October 18: The ledge spoken of last week as having been discovered by Mr. W. W. Kellogg, near Cherokee, has been tapped at considerable depth by a tunnel and a ledge developed which looks and prospects well. The owners intended to commence crushing on Monday last.

SHUT DOWN.—We are sorry to learn that the Greenville Co.'s (Union) quartz mill has been compelled to shut down for a time. We hope, however, it will be but a temporary stoppage.

GOOD YIELD.—About ninety tons of rock (for a test) from the Green Mountain ledge, owned by Hon. Geo. C. Perkins, were run through the Dixie mill, recently, and paid about $20 per ton. It is reported that Mr. P. intends building a new mill near the mine. There is an abundance of $6 and $8 rock in the Green Mountain, which can then be crushed at a profit.

REPORT.—It is currently reported that the Indian Valley mine is to soon change owners. A St. Louis (Mo.) Company contemplates purchasing. The Indian Valley is undoubtedly one of the best and most extensively prospected ledges in the county.

STRUCK IT.—Cap. Kohler informs us that one of the drifts in the Baker mine (Compton's) near Cherokee, broke into the ledge the other day, developing a 15 ft. vein of quartz which prospects splendidly, and has every indication of being a permanent mine. We are always glad to chronicle a rich "strike" in our mines.

SIERRA COUNTY.

IOWA MINING COMPANY.—Mountain *Messenger*, Oct. 18: This company intend resuming work in their mine as early as practicable, next year. They have a large amount of wood and other supplies on hand, left over when labor in their tunnel was discontinued.

TUOLUMNE COUNTY.

A FRAUD.—Tuolumne *Independent*, Oct. 18: There is a suspicion of fraud in the test rock from the new silver mine. The assayer who made the return had orders to test 1200 lbs. and reserve the other 800 for trial by another assayer. On a demand for the balance, reply was made that it had been thrown away. Although the rock was proved to pay splendidly, the boys have reason to believe, from suspicions circumstances, that the half was not told them, and that the rock was much better than represented.

THE GARIBALDI MINE has just developed an extensive chute of rock that will average $15 to the ton. The ledge is seven feet in thickness, and was struck in the north end of the 100 ft. level, on Tuesday last.

YUBA COUNTY.

A MINING DITCH.—*Appeal*, Oct. 18: J. L. Gibson is building a canal from Lost Creek to New York Flat, in New York township, for the purpose of supplying himself with water for mining purposes. The canal when completed will be fifteen miles in length, four feet in width and two in depth, which dimensions it is estimated will afford a capacity of 800 inches of water. There are engaged on the work of excavation at this time, over 100 Chinamen, and the work when completed will cost about $12,000.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, Oct. 18: Daily yield, 100 tons of ore, which is being extracted through the Gould & Curry shaft. The Mariposa mill has been running steadily on ore from the mine during the week, and the Bacon mill was started up day before yesterday. The body of ore opened on the 1167-ft. level has been breasted out 7 sets of timbers in width and 3 in hight, and continues to improve in quality as the development proceeds. The third compartment of the shaft is completed. The daily yield of ore will be increased as fast as mills to crush it can be obtained.

BALTIMORE CONSOLIDATED.—The main northwest drift, at the third station, is still being driven energetically ahead, the face of the drift in a mixture of clay, quartz and porphyry, with occasional spots and streaks of fair grade ore. The cross-cuts in the southwest drift from the main west tunnel, at the second station, which have cut the ledge, showing it to be about 20 ft in width, with 6 or 8 ft. of fine looking ore, the rest being considerably broken up and mixed with clay and porphyry, with spots and streaks of ore intermingled.

DAYTON.—The northwest drift at the second station, to connect with the winze from the old works of the first station, is being driven rapidly ahead. When the mine was first opened, an incline shaft was sunk on the ledge 100 ft. in depth, then a tunnel run from the north side of the hill which connected with the bottom of the incline, after which the incline was continued on the line of the ledge 120 ft. below the level of the tunnel, and a drift run northward which struck and developed the top of a chimney of fine paying ore. The level of this drift has always been known as the first station, and is 220 ft. below the croppings of the ledge. The first station in the shaft (second station of the mine) is 100 ft. below this drift and 320 ft. below the croppings. The ore-body at the second station has been breasted out 40 ft. in extent, and shows finely.

AMERICAN FLAT.—The main southwest drift, at the third station, has been extended 150 ft. south from its junction with the main west tunnel. Fifty ft. south of the Baltimore line a cross-cut west has penetrated the ledge 10 ft., showing a body of fine ore; 50 ft. further south another west cross-cut has tapped the ledge to the extent of 8 or 9 ft. Both of these cross-cuts are narrow drifts, barely wide enough for a single miner to work in and wheel out the rock excavated, and were run for the sole purpose of ascertaining the exact location of the ore-vein.

ELY DISTRICT.

MEADOW VALLEY.—Pioche *Record*, Oct. 19: In incline No. 3 have reached 120 ft. below the 9th level. At a further depth of 10 feet a new station, the 10th, will be made. The west drift from the 9th station is in 173 feet; the east drift 265 feet. The east drift from the 8th level is in 373 feet.

WASHINGTON AND CREOLE.—Three winzes, all of which are in ore, are being sunk on the ledge. Two of these are between 80 and 90 feet deep, and the third, which has lately been commenced, is about 12 feet in depth. When the winzes shall have reached a depth of 100 feet, which will be about the latter end of next week, drifting will be commenced from the bottoms of them.

PIOCHE.—The ore is again accumulating at the old works. There are now 25 tons on the dump.

CHIEF OF THE HILL.—A progress of 16 feet has been made in the west drift. At the bottom of the shaft a cross-cut has been commenced, and a progress of 7 feet has been made in it. The station has also been made at the same place.

AMERICAN FLAG.—The station at the 8th level, 800 feet below the surface, has been completed, and workmen are still sinking the shaft. Drifting from the new station has been commenced, east and west.

SPRING MOUNTAIN TUNNEL.—There have been no new developments to note since last week.

CAROLINE.—The sinking of the shaft continues. The contract which is now being fulfilled will be completed shortly.

RAYMOND & ELY.—The daily ore product is now 100 tons. There are 210 men employed in the mine at present.

PORTLAND.—The shaft has been completed to a depth of 300 feet.

SILVER PEAK.—The incline is completed to a depth of 330 feet. There are now about 50 tons on the dump.

CHIEF EAST EXTENSION.—The sinking of the main shaft has been resumed below the 225-foot level.

SPRING MOUNT.—The sinking of the shaft, and drifting continue.

HUHN & HUNT.—Work has been stopped in order that the engine and engine bed may be repaired.

AMADOR.—The men are still at the work of sinking the shaft.

LOUISE.—The workmen are getting some very good ore in the raise from the 200-foot level.

PAGE & PANAOA.—A winze is being sunk from the 360-foot level. It is now down 230 feet.

NEWARK.—Ore being crushed by the Amador mill.

STILL SINKING.—The Pioche Phenix and the Ivanhoe are sinking their respective shafts.

New Incorporations.

EL DORADO HILL GRAVEL M. C.—Oct. 22—Location: In Placer County. As Directors—G. S. Dodge, William Willis, J. F. Boyd, Charles E. Scott and G. M. Grayson. Capital stock, $2,000,000.

Meetings and Elections.

EXCHEQUER M. Co.—Trustees—S. Heydenfeldt, A. K. Green, F. G. Smith, L. Leavitt and D. T. Bagley.

AMADOR TUNNEL AND M. CO.—Trustees—James Morgan, N. C. Fassett and H. Myers; Secretary, Louis Kaplan.

SOUTH CHARIOT M. CO.—Oct. 20—Trustees—Hill Beachy (President), George S. Dodge (Vice President), A. P. Minear, T. J. Shackleford, John F. Boyd; Secretary, Frank Swift; Superintendent, C. S. Miller.

ATLANTIC AND PACIFIC M. CO.—Trustees: Isidor Burns (President), W. Holden (Vice President), J. J. Houseman, Daniel McCloud, S. Solomons, James Curtis, John Crocker, James O. Wright, H. Kosminsky; A. Noel, Secretary.

THE Bingham Cañon Railroad has been completed 12 miles from Salt Lake and commenced operations on the 16th inst. There are now only five miles of stageing between Salt Lake City and Bingham.

Quicksilver Extraction.

EDITORS PRESS:—At the risk of exhausting your good nature and patience, I venture to address you again on this important branch of metallurgy, hoping that before we are done with the subject some truth may come from the disoussion that the public may be safe in receiving and acting on as facts established. It is nothing new for scepticism to doubt new theories and improvements. Galileo only saved his neck by recanting the truth, and had I lived in his days I might have heen a head shorter, but, happily, in this day every man has the privilege of setting forth his discoveries or inventions to the world, which is the jury to try all propositions that are presented as facts; and as they decide, so must he atand or fall. Divine wisdom does not permit any one man to monopolize knowledge to such an extent that another individual may not also have a little; and that little may he as true, practical and important as the great learning of a man who has published a book. What I know about quicksilver, I have a good right to, for I learned it from practical working, from mining the ore to its final reduction, having devoted to the business twelve years of my life, during which time I have, with my own hands, manipulated every branch of the business; beginning the reduction with retorts, following them with what is usually known as the Almeden furnace, and finding objections to both, I determined to try something new, the result of which was the Knox-Osborne furnace. This, Mr. Editor, is my excuse for the impertinence of assuming to know something of the reduction of mercury for its ores, notwithstanding it mey he new to some one; and that Mr. "G.K." should dissent from the results of an operation he has never seen, and which is quite different from previous operations in the same line, does not surpise me.

"G. K." insinuates still that we lose some large amonnt of mercury in our process of reduction, which I deny, and offer him large inducements to prove the facts, whatever they may he. I want him to prove his theory, if he can. That will effectually upset mine. He also objects to my way of proving my complete reduction. Now, Mr. Editor, I never take second class evidence when I can get that which is first-class.

G. K. says my refusal to accept assays might as well he applied to copper, silver and other ores, and it gives me great pleasure to say I fully agree with him. Suppose for instance, a new invention for working silver ore, which it is claimed will save 99 per cent., or all the metal. I work some ore by the new apparatus, which the assayer certifies to its containing $100 silver per ton. During the working a competent chemist is hy to see that no metal passes away during the operation, and when completed, examines all parte of the machinery to see all hae heen properly cleaned up; examines the tailings remaining and finds not a trace of silver in it. He next weighs and assays the silver product, and finds he has $80 only. Now will you say that the sample assayed, which, (when taken fairly from a large pile of rock), at the best is but a guess, or estimate of an average, was an absolutely correct sample of the lot of ore worked? I choose to take an absolute certainty rather than an absolute uncertainty.

Now I put it to the oommon sense of your readers which is the most reliable, a sample guessed at hy regular sampling from a ton or a hundred tons, or the actual working of a ton or one hundred tons, where by daily, or if you please, hourly tests, you know you are saving all your metal? Assays are valuable when a working test connot he had, and to that extent only. G. K. thinks "it might he a good hint to millmen to retort their amalgam in similer furnaces," and here I agree with him, provided they have from ten to twenty tons per day, and I will hind myself to teturn them as much mercury as they get now and at about one-tenth of the expense, and never have a man affected with the vapors of the mercury, which is more than they can do with a retort, and the repairs on the furnace will he vastly less than the repairs of retorts for the same work.

G. K. quotes a numher of the reasons I give in support of my theory; all of which are true, and instead of attempting to answer them, quotes a part of two other sentences to show my hungling composition, which I take to be pretty good evidence he has no reasons to give and thinks a little dust thus thrown in the air, will settle the matter. G. K. also wants to know "how near" the truth the assay of 1 to 5 ponnds (cinnabar) will come? In reply I say, if done as done as a sample of a largerlot, 5 pounds will come nearer than one, and one pound nearer than an ounce, and an ounce nearer than a grain and either would only be approximate. Having above referred to the main points in Mr. G. K's. article, I will come right down to business. I assume that the public so far as they are in, or contemplating going into the reduotion of mercury, want to know the real facts about the 99 per cent claim, and it is of no small importance to true science to know whether it ia true or not. Your friend G. K. ia a very acientifio man, haa published a scientific hook or two quoted as authority everywhere, been to the World's fair at Vienna, to the Idra miñes and has seen the new reduction works of Mr. Patera, and with all the knowledge of Freiberg and the old world at his tongue and fingers snd—skeptical of the 99 per cent. claim; who was so compstent as he to test this thing and to insure the profits of enterprise, (for who is there that wants to work without pay)? Myself and partner will bind ourselves that when G. K. has constructed for us an attachment to, or an improvement of our present machiuery for reducing cinnabar, that will save one flask of mercury from our coke chimney, the debris, or what we lose from any and all parts of the furnace, while we save one hundred flaske—(in other words save one per cent. of the product of our works), we will bind ourselves to pay him $10,000 in gold coin. He may save it from anything we waste. If there is the large waste he assumes, it will not be difficult for a scientific man to save one per cent on the amount we get. I think you will agree that this ia a liberal proposition, and it is made in good faith, and not intended as a bluff, or for any other purpose than to have the 99 per cent theory proved or disproved. Thanking you for your indulgence heretofore, I remain yours, etc. R. T. KNOX.

Neglected Colorado Mines.

A correspondent of the Denver *Tribune* writes as follows: In passing through the various mining districts, on a tour of inspection, the singular feature of a great many deserted holes in the ground attracts attention. Some have been sunk to a considerable depth, fifty or sixty feet perhaps, while others are hut ahallow excavations. That these holes were dug in search of the precious metal is evident, hut the question—why there is nothing heing doue with them naturally arises.

In some cases an unusually inferior quality of ore is fouhd near the surface not exceeding fifty dollars in value per ton. After a few tons have heen taken out, a shipment is made and from the returns it is learned that the yield of the ore was only enough to pay for hauling and working; the expenses of each ranging from twenty to thirty dollars per ton, leaviug the miner a zero for the reward of his toil. Although every evidence ie manifest that the lead contains rich quartz in large quantities if opened to a required depth, the poor miner is forced to abandon his discovery for want of means to develop it.

In other instances where the mine hae been opened to a considerahle depth, and is turuing out good pay, a formidahle barrier makes its appearance and the miner finds his shaft rapidly filling with water. He hrings to his assistance all the availahle means which he is pecuniary ahle to procure—endeavoring to take out the water and prosecute his work. He is compelled to employ much extra help, and after having expended his limited capital in this way, he is forced to desert his enterprise.

It is no exaggeration to say that over a hundred valuable mines, rich in gold and silver, within half the numher of miles from Denver, are laying idle, which might he worked with large profit, if properly managed.

When the ore is of a low grade machinery is needed to dress and separate it at the mine ohviating the hauling of worthless rock long distances over steep roads; and where water is the barrier machinery is necessary to profitahly contend with the ohstruction.

A small engiue of about ten or twelve horse power would he of sufficieut size to run machinery for dressing the quartz, work the shaft and keep pumps in operation, if necessary. Such an engine, together with the machinery and pumps, could be put on the ground and set up ready for use at an outlay of $3,000 to $5,000, and in addition to its service in working the machinery, would save the lahor of two or four men on the shaft—an expense of two to four thousand dollars per annum.

In every instence where an experiment has heen made with machinery for these purposes, it has proven a complete success. The mining company of Nederland, at Carihoo, have beoome so well convinced of the invaluable aid of machiuery that arrangements have heen made for putting up a hundred horse-power engine at their mine. Thie is a subject of much oonversation in the mining districts, hut the question is how are men of meaus to be made interested, aud capital brought to the assistance of experience and labor, in developing our untold wealth of mineral resources.

The field is open, the harvest is waiting. Come forward, men of enterprise, invest your money and success will crown your efforts with the golden wreath of wealth.

TROY DISTRICT.—The White Pine *News* saye: Mr. Edward Davies, Superintendent of the Troy Silver Mining Company, limited, was in town during the early part of the week. He brought up a har of hullion of the value of about $600, produced at the company's mill. The oharaoter of the ore has heretofore proved so difficult to work that the bullion has been very low, and was scarcely worth shipping. The recent workings have been more successful, aud the Superintendent is quite confident of producing in future bullion of approved fineness. That brought to thia place runa to about 600 fine. Dr. Steward, of the Board of Directors, arrived from Lancashire, England, has gone to Troy to make an examination of the company's property, with the view of reporting on the same to the stockholders at homs. The problem hss hesn as to the practicability of getting ths silver contained in the ores, and as this seems to hs in a way of satisfactory solution, we apprshend that operations will he inaguated upon an extensive scale so soon as the report is submitted to his associates. The quantity of ore in the mines helonging to the company is demonstrated to be abundant to supply the mill and furnace for yesrs.

The Refining Works at Black Hawk.

The smelting center of the mines is not in Denver as yet, and judging from the general looks of things, will not be for some time to come, though in the end it is as sure, we helieve, to locate itself *somewhere* upon the plains as the night follows the day. In the meanwhile none of the mountain cities present so many advantages for the erection of extensive metallurgical works as Black Hawk. Its location, in the heart of a great mining district; its railroad connectiou, which, in a few months, will be direct with the east, and is at present so with most of the prominent coal fields of the Territory; all favor a cheap and advantageous treatment of the complex ores of Colorado. In addition, the Gilpin County mines furnish an unlimited quantity of that nece-sary article to all smelters—finx—not only at low cost, hut at an ahsolute profit.

No estahlishment that has bid for our ores, has heen so uniformly euccessful with every class as the Boston and Colorado Smelting Works. Nothing carrying silver or gold, or both, has ever heeu refused, providing the seller hes heen willing to accept the prices offered; and while these have often heen the subject of criticism and diesatisfaction, that is a matter entirely separate from the question of successful reduction. Prof. Hill has bought Clear Creek zinc and heavy lead ores when no one else would touch them, aud is uow handling daily tons of Boulder county rock that can be profitahly smelted hy no other works iu the country. His establishment has furnished a market for refuse tailings from the hed of the creek, and his furnaces have held ores from uearly every mining camp on the eastern slope of the Range. While perhaps the rates and prices at Black Hawk are fit subjects for criticism, it cannot he denied that the works have proved of immense heuefit to miners all arouud them.

The erection of works to refine the copper matte, now shipped to England, will vastly increase the usefulness of the establishment and inaugurate a new industry that may fairly he expected to grow to huge proportions hefore a dozen years are past. The primary works can be and have been duplicated in other districts, as the Whale snd Swaneea Mills and those at Alma and Dudley, hut there are many reasons why the final separation of the metals can most profitahly he performed under one management. The present enterprise contemplates all that will be necessary for Colorado for some time. Its success can hardly he doubted, as apparently every element has been carefully considered hefore the project was finally determined upon. That times are rapidly changing as regards the comparative cost of lahor and work in the United States aud England is well shown by the fact that the difficult operation of refining a complicated copper matte, can he nearly as cheaply performed in Colorado as in Swansea, what additional expense there is, being much more than balanced by the saving of shipping and handling costs hetweeu here and Europe.

Within sixty days, probably, the refining works will he in operation. Their first successful run will mark a new era in the mining industry of Colorado.—*Colorado Mining Review for Sept.*

WHITE PINE BASE ORES.—We remember that with the more sagacious and well informed of those who came early to White Pine, the prediction was common that the ores of the hase range would ultimately prove the more solid foundation of prosperity to the district. At that time the wonderful richness of the chloride ores of Treasure Hill carried off in a whirl of excitement the capitalists who swermed to the "poor man's paradise," and left almost unnoticed this extensive field of operations. The hase ores failed to arrest the retiring wave of population, and still lie unwrought in their natural deposits, over the Babylon and White Pine mounteins. There ledges are numerous and have been partially prospected. The orees are found, in addition to large percentages of copper and lead, to carry variously from $30 to $300 per ton in silver The attempts at smelting made in the early days of the district were conducted without that skill and kuowledge of the business which has been obtained since that time, principally in the districts of Eureka, and in Utah. Attention is now being given to the neglected hase mines here, and we may reasonahly expect to see them sought for and utilized as this branch of mining industry becomes better understood. Gentlemen of skill who have examined the subject and are well acquainted with the value and aspects of the base veins of the country, express the opinion that those of White Piue yield ore of a higher percentage in silver than ore found generally in this State or in Utah. The fact is indisputable, that ores very inferior to onrs are energetically worked in other parts of the mining region. A profitable field of enterprise in this department invitea men of skill and capital to this district.—*White Pine News.*

The Seraing Works in Belgium.

An English newspaper gives the followiug account of this great industrial establishmsut:

"The Seraing works extend over an arsa of 200 acres, and are interssoted in all directions hy a total length of 34 kilometres of railway. A canal also runs through the works communicating with the Meuse. At present there are 9,000 persons employed in and about the worke, and the company still require about 1,500 more hands, hut there is some difficulty in ohtaining them, as all the availahle labor of the surrounding districts is already absorhed. The first locomotive for the first Belgian railway was constructed at their works iu 1834, and afterward they supplied all the engines for the early railways.

The inspection occupied several hours, during which all the departments were visited in turn, the chiefs of each department, who are engineers of high qualifications, giving to the visitors detailed explanations of the several branches of the works. The working of the estahlishment comprises coal and iron mining, the reduction of the ores, the manufacture of cast and wrought iron and steel, the construction of machines and engiues of every kind, boilers, hridges, ships—in fact, all classes of engineering work. There are offices for the direction, a special engineering department for the study of construction, a library, a lahoratory and eleven special divisions for the practical working, which are managed hy the chief engineers alluded to. Nothing can exceed the cleanliness, order and precision which prevails throughout the estahlishment, which was a matter of euvy to many of the manufacturers and ironmasters from our own land.

It is almost impossible to realize the magnitude of the worke; a few facts and figures, however, respecting their administration may serve to indicate their extent. They employ nearly 260 steam-engines, of ahout 8,000 horse-power in the aggregate, and the wages paid amount to 8,500,000f. per annum. The annual consumption of fuel is 350,000,000 kilogrammes, and the value of the yearly produce is estimated at from 25,000,000f. to 30,000,000f. The company have an infirmary on the hights of Seraing, in a very healthy situation, which is kept hy nuns. A special physican ie attached to it, and an orphan asylum, containing at present 41 children of hoth sexes, adjoins it. The estahlishment also possesses a dispensary, which furnishes medicine gratuitously to the persons attached to the works and to their families. To each division a refectory is attached for the workmen's meals; some kitchens are added; haths are also fitted up at the collieries for the miusrs, of whom there are about 2,000. A society for relief and pensions has also heeu estahlished for the workmen, hut memhership is not compulsory. The company also accords out of its own funds temporary relief and pensious to non-subscribers to the relief society. Up to the close of last year the Seraing Works had constructed 2,100 steam engiues of from 4 to 600 horse-power for all manufacturing purposes; 900 locomotive eugines; 31,540 pieces of mechanical apparatus for manufactories, mining, the reduction of ores, the manufacture of metals, huilding, sugar works, plate-glass manufactories, paper mills, spinning mills, besides girder and suspension hridges, and irou-clad turrets, etc."

"THE SAME KIND OF ROCK."—The Tulare *Times* under the head of "Fine Cahinet" gives the following: Since there has heen so much excitement about the new mines, and nothing ia talked of on the street but "feet," our young friend Mack (with Jacob and Einstein), in order to keep up with the times has collected some fine specimens, principally from ths back alleys and Mill Creek hed, with which he hae heen "fooling the hoys." One fine semple of ore laheled "Cinnahar from Humhng District," was pronounced by a well known sheep man to he the richest piece of cinnahar ore he ever saw. He will be surprised to learn that nearly all our stores are huilt of such "specimens," that it was picked up in the hrick yard. A piece of cohhle stone, granite, sand stone or any kind of rock laheled from "Roorback District," or "Sham Ledge" was eagerly pounced on hy "knowing ones" who explained to admiring friends how this was rich in snlphurets, that in free gold and the other in virgiu silver. One old bone, the crevices of whioh had heen stuffed with leef gold was recognized by many as "just tha seme character of rock we mined in Nevada Co.," "for all the world like the finest specimens of Comstock," etc., etc. We verily believe an old hoot top or a hoop-skirt would be pronouuced some new sample of ore. What a Golconda of wealth Visalia must be huilt on, if its back alleys yield such rich specimens!

A NEW CAR, intended for railway coustructiou and hallasting purposes, has been introduced into the United Statee. The floor is composed of a series of trap doors, which, when open, make a kind of grating, and when closed form a level surface. Being loaded with ballast, and removed to any required spot, the oontents, by simply loosening a bolt, drop through npon the track, and an arrangement beneath securea their distribution between and outside the rails, which are kept clear. The invention is claimed to coet but little above an ordinary platform car, and it evidently saves much time in shoveling.

Useful Information.

Resistance of Woods to Strain.

Professor R. H. Thurston, of the Stevens Institute of Technology, communicates to the *Journal of the Franklin Institute* a description of an apparatus devised by him for determining the torsional resistance of materials, and also the result obtained by submitting specimens of different woods to experiment. By mechanism the force producing torsion is transmitted through the test-piece, and moves a pencil which traces upon paper a curve, the ordinates of which are proportional to the torsional moment, while its abscissas represent the amount of torsion to which the specimen has been subjected, thus indicating the relative stiffness, strength, and resilience of the material experimented upon very perfectly. The test-pieces were seven-eighths of an inch in thickness at the middle or smallest part. Some of the conclusions drawn from the results are as follows: White pine yields quite rapidly as the torsional moment increases. The maximum strength of the test-piece was 15¼ foot-pounds, and it was twisted completely off at a total angle of torsion of 130°. The substance is thus shown to have little resilience. Yellow pine has much greater strength, stiffness and resilience. The sap-wood is equally stiff with the heart-wood, but sooner passes its limit of elasticity. Spruce is less stiff than white pine oven, but possesses greater strength and resilience, its moment of resistance reaching 18 foot-pounds and twisting through a total angle of torsion of 200°. Ash seems to be weaker and less tough than is generally supposed. Its most striking peculiarity is its very rapid loss of strength after passing its limit of elasticity. Spanish mahogany is very stiff and strong. It is deficient in toughness and resilience, losing its power of resistance very rapidly after passing the limit of elasticity. White oak has less torsional strength than either good mahogany, locust, or hickory, but is remarkable for its wonderful toughness. It passes its limit of elasticity at 15°, but loses its resisting power very slowly. The latter remains unimpaired to a torsion of 70°, and yields completely at 253°. Millwrights are evidently correct in holding this wood in high esteem for strength, toughness, and power of resisting heavy shocks and strains.

Ice for Keeping Fruits and Vegetables.—A correspondent of *The Field*, an English journal, relates his experience in keeping fruits and vegetables in an ice-house. He says: "I lay them upon cotton, in tin boxes (biscuit boxes will do) without any packing about them, shut down the lid, and set the boxes on the ice, not buried in it. Peaches I have kept quite a month in this way after they were dead ripe, and nectarines six weeks. I place them in shallow tin boxes, putting a piece of cotton between the fruits, but otherwise leaving them uncovered. After they have been long on the ice they should not be brought out long before they are used, as they do not keep long afterwards with out showing specks. Tender-fleshed melons, that will not keep a week in the fruit room in summer, will keep three or four weeks in the ice-house. Cucumbers will keep a very long time, and I have known the autumn and winter supplies greatly prolonged by storing them away in boxes in the same way as fruit. French beans should be packed in bundles and set on their ends in boxes. I am sure those who try the plan once will resort to it again."

Economical Scents.—As cheap perfumes are often required to fill little fancy bottles, such as are sold at the bazaars, toy-shops, arcades, and other places, the following recipes for their manufacture will be found of service:

1. Spirits of wine, one pint; essence of bergamot, one ounce.

2. Spirits of wine, one pint; otto of santal, one ounce.

3. Spirits of wine, one pint; otto of French lavender, half ounce; otto of bergamot, half ounce; otto of cloves, one dram.

4. Spirits of wine, one pint; otto of lemon grass, three-fourths ounce; essence of lemons, half ounce.

5. Spirits of wine, one pint; otto of petit grain, quarter ounce; otto of orange peel, half ounce.

Varnish for Labels.—Never varnish a label for acid bottles, but use paraffine instead. The only thing necessary is to brush the paraffine on as hot as possible, so as to get a thin, even coating. It looks as well as varnish, and stands a great deal better. It saves a great deal of trouble in sizing and varnishing, and five minutes after the bottle has been brushed it is ready for use. Instead of sealing the tops of bottles—sample bottles of bleaching powder, and for other purposes—it is very convenient to have a small porcelain dish with paraffine always ready, which can be placed upon a lamp, and, as soon as warm, dip the top of the bottle in it, which gives as good a sealing-wax, or better, and causes very much less trouble.

Mucilage of Gum Arabic.—According to R. Rother, the following formula affords a mucilage which will keep in the hottest weather:—

Gum-Arabic	12 troy ounces.
Glycerine	8 fluid ounces.
Water	16 fluid ounces.

Enamel for Copper Cooking Vessels.—To enamel the inside of copper cooking vessels in which acid fruit and vegetables are cooked, and thus prevent the formation of the so-called "verdigris," the following method is recommended: Twelve parts of white fluor spar, twelve parts unburnt gypsum, and one part borax are finely powdered, intimately mixed, and fused in a crucible. The fused mass is then poured out, and after cooling is rubbed up to a paste. The copper vessel is to be coated inside with this preparation, applied by means of a brush, and the vessel placed in a moderately warm place, so that the coating may dry uniformly; after which it is subjected to a gradually increasing heat, till at length the preparation fuses. On cooling, the vessel is found to be protected internally by a white, opaque enamel, adhering very firmly to the copper, not chipping off by ordinary knocking and rubbing, and impervious to vegetable acids.

Oil-Cloth Made from Carpet.—The following recipe is communicated to the *Cultivator and Country Gentleman*, by a correspondent, who signs herself "Daisy Eyebright:" Nail the old Brussels carpet loosely to the floor, in a large attic or wood-house chamber not in use. Then paint it over with a thick coat of linseed oil and burnt umber. Let it dry in thoroughly; add a coat of good varnish. Let that dry for a week or two, and it can be scrubbed and washed with milk and water like any oil-cloth. Paint it on the wrong side, and nail it down closely, for it need not be taken up for many years. As the varnish and paint wear off, renew them, and thus it will last four times as long as common oil-cloth. If "B" chooses, he can ornament it with a border of scarlet, green or blue lines.

Preparation for Lacquering Brass Castings.—Take of seed lac, 6 oz., amber of copal, ground on porphyry, 2 oz., dragon's blood, 40 grains, extract of red sandal-wood obtained by water, 30 grains, oriental saffron, 36 grains, pounded glass, 4 oz., very pure alcohol, 44 oz. To apply this varnish to articles of brass, expose them to a gentle heat and dip them into the lacquer. Two or three coatings may be applied if necessary. The lacquer is durable and has a beautiful color. Articles varnished in this manner may be cleaned with water or a dry rag.—*Cabinet Maker.*

Good Health.

Twenty Rules for Health.

1. Remember, the Author of the laws which govern the human body is the author of the Ten Commandments.

2. Infidelity to the laws—established that mankind should be healthy and happy—is the greatest sin of the present generation,

3. Be cheerful, trustful of others, and faithful to your own best conception of duty. Never brood over troubles that you have, and be sure you never borrow any.

4. Be much in the sunlight, and prefer light-colored clothing.

5. Drones must die. Exercise liberally and live. Be out-doors all you can while the sun shines.

6. Breathe pure air. Live with open windows, and the windows of heaven will be more likely to open for you.

7. Pray with a pure heart and a clean skin. Bathe often.

8. Avoid stimulation by spirits of all kinds, strong coffee and tea, opium and tobacco.

9. Keep the head cool, feet and heart warm, hopes heavenward, and finger nails clean.

10. Eat only three times daily, and never between meals—not a nut or an apple. Drink nothing while eating.

11. One hearty meal of meat per day is sufficient. The other two should be spare.

12. Avoid late, hearty suppers, pork, spices and pepper, rich pastry, and imperfectly cooked beans.

13. Wheat, oat and barley meal, with beans, peas, lean meats, fish and wild game are the best articles of food.

14. Fruits are cooling to the blood, and specially adapted to warm weather.

15. Eat slowly, masticate your food well, and eat nothing for three hours before retiring.

16. Let the time spent at table be happy. Encourage pleasant, cheerful conversation; joke, but do not argue. Rest a half-hour after every hearty meal.

17. Sleep eight hours of each day.

18. Brain, bone and muscle are built of different material, and the brain-worker should have food different from the muscle-worker. He is not thoroughly educated who cannot select food adapted to his needs.

19. Avoid corsets, and suspend no article of clothing from the waist. Protect every part of the body from chill and exposure.

20. Study hygiene, attend health lectures and read health literature. As you are ignorant or intelligent in physiology will your habite be wise or otherwise.

About Children.—Dress children warmly, woolen flannel next their person during the whole year. By every consideration, protect the extremities well. It is an ignorant barbarism that allows a child to have bare arms, legs and feet, even in summer. The circulation should be invited to the extremities; warmth does that; cold repels it. It is at the hands and feet we begin to die. Those who have cold hands and feet are never well. Plenty of warmth, plenty of substantial food and ripe fruits, and plenty of joyous out-door exercise, would save millions of children annually.

Artificial Fibrine as Food.

Pertinent to the subject recently discussed in the article entitled "Chemical Food for Men and Animals," we find in the *British Medical Journal* a communication from Dr. John Goodman upon artificial fibrine, as food, in which he strongly recommends it as a diet for sick persons, and gives the following directions for its manufacture and use: "As a member of the British Medical Association, and in the common interests of humanity, I have pleasure in calling attention to my discovery of this new dietetic substance. So far as I have employed it, it promises fair to be invaluable in medical practice, especially in cases of feeble alimentation and deficient nutrition, and second to none in those cases where rejection of food forms a prominent feature, or where the appetite and digestive powers are reduced to a minimum. As fibrinous material, it is of course highly nutritious, and eminently adapted to all cases where there is a deficiency of fibrine in the blood. It is, perhaps, unparalleled in its qualities of lightness and digestibility, and is, moreover, a great delicacy. In many urgent cases of rejection of food, etc., it not only remains where an egg otherwise cooked would not be tolerated, but its presence in the stomach has been found to create a feeling of want rather than of superfluity, and to promote rather than decrease the appetite for food.

"The production of this substance is within the reach of every sick room, and is effected with great facility. It is formed by exposing albuminous material to the operation or influence of cold water, for a given period; and on account of its great plenteousness we employ the ordinary hen's egg for its production. When the shell is broken and removed, and its contents are immersed in cold water for twelve hours or so, they are found to undergo a chemico-molecular change, and to become solid and insoluble. This change is indicated by the assumption, by the transparent white of the egg, of an opaque and snowy white appearance, which far surpasses that of an ordinary boiled egg. The product, and the fluid in which it is immersed, must now be submitted to the action of heat to the boiling point, when the fibrine will be ready for use."

About Clothing.

The underclothing—we mean its deepest strata in immediate contiguity to the body—has quite as much to do with a person's comfort, health and good looks, and consequently with his or her success in life, as the outside apparel, public opinion to the contrary notwithstanding. It is pertinent, here as elsewhere, to look beneath the surface to form our judgement of the individual.

Cleanliness we take for granted. "Foul linen," and healthy skin are incompatibles. Falstaff himself, whose stomach was not easily turned, could not abide the "rank compound of villainous smells," which he suffered in the buck-basket.

The first quality demanded in the articles which come next the skin is, that they be soft and comfortable. They must not irritate, nor be chilly or heating. To our mind, one of the most dreadful penances of convent life is that mentioned by Victor Hugo in *Les Miserables*. He says that the nuns of a certain order are obliged to clothe themselves in harsh woolen cloth next the skin. The irritation is so distressing that they are not unfrequently thrown by it into a fever, and break out in an eruption from head to foot.

The amount of clothing should be carefully adjusted to the temperature. When too scanty, the skin is chilled and is liable to crack; when too abundant, the excessive warmth may cause an eruption and itchiness.

Cotton, linen, wool and silk are the prevailing materials employed. Of these cotton is the cheapest and commonest. It is a good conductor of heat, and is the best adapted of any of them for warm climates and the hot season. Its fibers, however, are coarser and rougher than those of linen, and there are persons so sensitive to this slight difference that they cannot wear it. Such must have recourse to linen.

For cold weather, wool or silk is preferable. Both these have one objection. That is, that on the slightest friction they disturb the electricity of the skin, cause a determination of blood to the surface, and sometimes lead to cutaneous eruptions. This holds good, more particularly against silk, which, in point of texture, is much more agreeable than even the finest wool, and is also a worse conductor of heat. The latter is an advantage in winter.

Ingrowing Toe-Nail.—In bad cases the following course is recommended to surgeons and others: If a small, thin, flat piece of silver plate be bent at one edge into a slight deep groove, and, after the toe has been poulticed twenty-four hours, slipped beneath the edge of the nail, so as to protect the flesh from its pressure, and the rest of the thin plate bent round the side and front of the toe, being kept in position with a small portion of resin plaster passed round the toe, a speedy and almost painless cure will take place, and the patient, after the first day, has the additional advantage of being able to walk.

Domestic Economy.

Plants in Rooms.—The reason why plants fade so soon, is because due attention is not paid to them. The mere supplying with water is not sufficient. The leaves should be kept perfectly clean. "If as much washing were bestowed, in London," says Dr. Lindley, "upon a pot-plant as upon a lap-dog, the one would remain in as good condition as the other. The reasons are obvious. Plants breathe by their leaves; and if their surface is clogged by dirt, of whatever kind, their breathing is impeded or prevented. Plants perspire by their leaves; and dirt prevents their perspiration. Plants feed by their leaves; and dirt prevents their feeding. So that breathing, perspiration, and food, are fatally interrupted by the accumulation of foreign matter upon leaves. Let any one, after reading this, cast an eye upon the state of plants in sitting-rooms, or well-kept greenhouses; let him draw a white handkerchief over the surface of such plants, or a piece of smooth white leather, if he desires to know how far they are from being as clean as their nature requires."

How they Cook Beans in Maine.—I wish some of your readers who stew beans would try the following receipt for baking them. This is the way the down-east lumbermen cook them, who eat them twice a day for four or five months each year: Take one quart of beans; first soak, if pea beans, until they are swelled full; it will take over night certain; if yellow-eyes, par-boil until the skins crack open when blown on with the breath; drain off the water, put about two-thirds of the beans in the pot; put in about one and one-half pounds of salt fat pork, then the rest of the beans; bake not less than twelve hours, first covering the beans with hot water.

These are genuine Yankee pork and beans. The way they are cooked in the woods is this: A hole is dug at the foot of the fire, filled with hot coals, the bean pot put in, filled around with coals and covered with hot ashes, where it remains from 3 p. m. until breakfast the following morning—about fourteen or fifteen hours. There are probably more beans eaten in Maine than in the whole State of New York. —*New York World.*

To Clean Lamps.—Bronzed lamps should be wiped carefully; if oil be frequently spilled over them, it will cause the bronzing to be rubbed off sooner than it would disappear by wear. Brass lamps are best cleaned with crocus, or rotten stone and sweet oil. Lacquered lamps may be washed with soap and water, but should not be touched with acid or very strong lye, else the lacquer will soon come off. When lamps are foul inside, wash them with potash and water; rinse them well; set them before the fire, and be sure that they are dry before oil is again put into them.

Lamps will have a less disagreeable smell, if, before using, the cottons be dipped into hot vinegar, and dried.

Directions for Carpets.—Carpets should be taken up and shaken thoroughly, if in constant use, as often as three or four times in a year, as the dirt that collects underneath them wears them out very fast. Straw kept under carpets will make them wear much longer, as the dirt will sift through, and keep it from grinding out. Carpets should be taken up as often as once a year, even if not much used, as there is danger of moths getting into them. If there is any appearance of moths in carpets when they are taken up, sprinkle tobacco or black pepper on the floor before the carpets are put down, and let it remain after they are laid down. When the dust is well shaken out of carpets, if there are any grease spots on them, grate on potter's clay very thick, cover them with a brown paper, and set on a warm iron. It will be necessary to repeat this process several times to get out all the grease.

Boiled Beef Plate or Flank.—Take a piece of beef flank, six or eight inches wide, and as long as you can get it. Sprinkle salt on, if fresh; prepare stuffing as for fowls, and spread over it; roll up very tight, and tie with strings to keep in place, as the heat will cruel it. Then tie or sew it up in a cloth, and drop into rapidly-boiling water; cook several hours; the larger the piece the longer it will take. Try with a fork. When done, lay between boards or in a pan, and put a weight on it, keeping the cloth on it still. When cold, it will slice beautifully and is excellent.—*Germantown Telegraph.*

Tapioca Cream.—One quart of milk, four tablespoons of tapioca, one cup of sugar, a little salt and three eggs.

Soak the tapioca over night in one-third of the milk. In the morning let the rest of the milk come to a boil, then stir in the tapioca, sugar and yolks of eggs, boiling about five minutes. Beat the whites to a stiff froth, add at the last moment and place on the ice. Flavor with almond.—*Mass. Ploughman.*

Indian Baked Pudding.—Take two quarts of sweet milk, and boil one quart, and while boiling stir in it as much fine Indian meal as will make a very stiff batter; add a tablespoonful of salt, and make very sweet with molasses. Butter a pan, and pour the remaining quart of milk over it. Cut little bits of butter and put on the top, and bake two hours in a moderate oven. Any person who has never eaten of it before, will think they are eating custard.

MINING AND SCIENTIFIC PRESS.

American Mines in London.

The sharp tricks of a few swindlers and world-be capitaliets in pntting worthlees American mines on the English market has done more harm to legitimete mining enterprisos on thie coast than can well be calonlated. Fully as mnch, if not more, injnry to these intereste has been done by pntting really good mines on the market at a price far heyond even their prospective velues. Plenty of good mines havo been floated there, which, if worked economically by private individuals, after having been bonght for snch a price as private individuals wonld be likely to pay, wonld have proved good investments. Bnt when these properties are first bonded for a emall sum to partiea who put them on the market through other individnals, all of whom want to make a large enm ont of them, by the time etockholders buy their eharee they have to pay ahont ten times as mnoh as they are worth. These evils, however, effect their own cnre, the question being only one of time. Burnt children dread the firc, and swindled stockholders bny no more mines. A correspondent writes that "A man in London will almost knock yon down, if you mention an American mine to him," and thinke that "a mine which tnrned out gold twenty-dollar pieces wonld not sell in London to-day."

Of course it wonld not; the better the mine the more money the Directors and "floatere" wonld make. A mine which turned out twenty-dollar pieces wonld never pay any one of ite stockholders, except the immediate managers themeelves. They would have caves, firee, overflowe and accidents of all kinds to prevent the mine being worked, and would at the same time be taking out the twentiee, privately from an "old shaft" or "deeerted tunnel." When all the twenties were gone, as they soon would be, they would eell out themselvee and wouldn't even pay the bille, but leave them to be paid by assessments. Then, with an air of injured innocence, they would deny everything on general principles, or, with Tweedish effrontery, aek: "What are yon going to do ahout it?"

That is just the difficulty: "What are we going to do ebout it?" Of all the barefaced swindles and ealted mines of which we have heard, we have yet to learn that punishment hes been meted out to those connected with them. The larger the swindle, the lese denger of tronble. A poor devil of a miner who steele a bucketful of rock from a "specimen mine" will be driven from camp, while a "promoter" who hange aronnd honest men, bonding mines, selting mines, eelling holes in the ground at exorbitant prices and swindling right and left, is looked up to ae a smart chap, and his society cnltivated.

These individuals generally are smert cheps, who are too lazy to work and too cowardly to steel ontright, but hesitate at nothing where money cau be made. They do more herm than the moet practiced burglar. The people who bny mining sharcs are to a great extent, particnlerly in London, those individuals who heve smell incomes and who desire to increase them more than legitimate interest will do. They are allnred by fleming prospectuses and *ex parte* reporte over the namee of men of cepital well known among them, and of their own nationelity.

And here is one of the worst evils. We have no desire to shield the Americans who attempt to swindle onr cousine over the water, hut any candid mind must admit thet much of this thievery is enconraged and fostered by Englishmen themselves. In this they are worse than our own countrymen. The people who take these properties to London to sell are generally men of no meens, but who hope to realize a fortune without labor or capital invested; in fact they invest nothing but their time, which ie worthless. When they arrive in London they are powerless nnlese they obtain the nemes, ae directors, of men of meens known in the community. To their sheme be it said plenty are to he found who in coneideration of certain shares and promises of money, will allow their names to appear as commending property of which they know nothing. The English pnblic in seeing English names as promoters think they ere secure in investing and do invest accordingly. Nine times out of ten the directore don't know anything about the mine, and only have a vague idea of even its locality. When a large nnmber of sheres ere sold they get their money, then sell their own sharee end get ont before the crash. Fortunately for them they are not blemed. It all falls on the "swindling Americans," who are publicly denounced not only by etockholders bnt by the directors who assisted them to floet their mine.

Now these men went at leest 100 per cent, and eometimes 1,000 per cent more then the valne of the mine for the bese use of these names without any investment at all. This is a eermon in itself. For certein snms of money and stock they lend themselves to cheating their own countrymen and theu lay the blame on othere. Any one familier with the eubject will know that there is not the elightest exaggeretion in what we heve eeid. We wish it were possible to get hold of all the Americans who heve practiced these infamons operations, put them down the deepeet shaft on the coast and oover them up with the worthless shares they have sold end the salted rock they heve exhibited. The Amerioan name abroad ie one not to be envied, end we are credited with the faculty of cheating whenever we get a chance. Thus the acts of a few thieves have tarnished the name of a people. Let the Englishmen look well into the anteoedents of those of their own conntrymen who float theee mines, before they inveet. Let them ask what has been done in the same line by them before. Let them denounce, high or low those, people who have lent their namee to assist in ewindling shareholdere and have nothing more to do with any property where their names appear. The general pnblic of our coast deplore the facts that fraude have been perpetrated more than any oue elee, as there are plenty of *good* mines which only want capital to be developed, and we have not any capital to spare at home. We need some from England and hope our English friends will uot condemn the mining commnnity wholesale on account of the presence among them of a few thieves.

New Map of California and Nevada.

The State Geological Survey has just completed a new map of Californuia and Nevada, which will be issned to the public in a few days. The map is on the scale of 18 miles to an inch, and is about 44x38 inches in size. In the compilation of this mep the following material has been used. For California, the work of the State Geological Survey and that of the United Statee Coast and Land Survey. For Nevada, the work of the Fortieth Parallel Snrvey, under Clarence King; the U. S. Engineer Explorations, under Williamson and Wheeler; the Central Pacific Railroad Survey, under Butler Ivee; and the work of the California Survey, by Wackenrueder, Craven, Wilson and Loehr, from 1863 to 1872.

The new map is finely executed and every trouble hes been taken to make it absolutely correct. No other meps heve yet been made with the same correctnees of topography. The maps heretofore made of California are crude compared with this, and that of Nevada far excele anything yet published. All of the ground hes actually been gone over and cerefnl snrveys mede. The monntein ranges and spnrs have been carefully given and a view of the map gives a eplendid idea of the topographical eppearance of both Celifornia and Nevade. Altogether the map is a handsome one and reflects credit on the State Geologicel Survey. The mep delineating the geology of the country with gravel ranges, etc., is not yet complete, but it will not now be long before it is finiehed. A glence at thet will give people away from here a better idee of the extent of our mineral conntry then they cen possibly get from any other source.

The James Lick Observatory.—A Generous Gift to Science by a Californian.

In a peper reed at the last meeting of the California Academy of Sciences by the Preeident, Prof. George Davidson, he made an announcement which will be read with pleesure throughout the scientific world. It is in effect that JAMES LICK Esq., one of San Francisco's wealthiest citizens, will erect at some point on the Sierrae an estronomical observetory, which ehall eclipse any thing of the kind ever mede. The full text of Professor Davidson'e peper will be found in another column. The telescope will be the largest thet American skill cen devise, and every variety of apparatue commensurate therewith will be eupplied, together with all neceesery fnnds to meintein an institntion of the kind hendsomely. In the encouraging words of Prof. Devidson, "There will he no let or hindrence in cerrying out his views; the amplest meens are provided; the rarest skill has been invoked and the plans are teking definite and practicel shape.

It must be a source of gratificetion to every Californian, whether a lover of science or not, to known that there is in the State en individual public-spirited enough to furnish the means to erect and meintain an observatory of the kind, and to know that the young State of California will heve the honor of heving within ite bonnderies a scientific institution which will excel any other of like charecter in the world. As Ma. LICK's generoue endowment will no donht allow the Trustees to employ the most eminent scientific men to teke charge of the observatory, the results attained will redound to the honor of our nation end onr State as well ae to the benefactor through whose liberality the researchee are carried on.

The deteils of the plan are not yet mede public, hnt MR. LICK is quietly perfecting his errangemente, and even now a surveyor hae gone to the mountains with a view of reporting on the different mountain peake. The site of this observetory shonld, however, not be chosen without mature deliberation. Altitude is not the only reqnisite. The geology and meteorology of the choicest locatione should be carefully compared, and the most prominent scientific men of the country should be conenlted with reference to the matter. Somé peaks, which would be accessible and prominent, might be, like Teneriffe, cloud-capped so mnch of the time, that few nights of tho year would he available for observation. Then, again, it would be advisable to locate the observatory iu a place eaeily acceseible from the prominent linee of travel, ae it will no doubt become, like Yosemite and the Geysers, one of California's wouders.

The crest of tho Sierras, say three or four miles sonth of the Summit, might be a fine place for a locstion, for at thet distance are eeveral high peaks from which a road conld be built to connect with the trans-continental railway. North of the old Placerville road acrose the Sierra and overlooking Lake Tahoe and the whole valley of the Sacramento, are several maghificent peaks snitable for such a site. The clearness of the atmosphere at high pointe on this coast has beeu fully established, and snch would be the attractiveness of a large building of this kind that touriste would visit it, even if it were 15,000 feet up on the mountains. In fact it would be one of the points of interest in California for visitors to see, and everybody would make a pilgrimage thither.

Ma. LICK's praiseworthy ambition leade him to desire that the teleecope shall be the largeet in the world or rather the most powerful and effective. That of Lord Ross is two feet in diemeter, hnt it ie a reflector and loese helf its light hy reflection. The glass in the teleecope in Weshington, mede by Clark, is actually 27½ inches in diemeter, bnt when in ite cell efforde only 26¼ inches working aperture. The large one in Cambridge is a refractor of 15 inches clear end givee an area of 180 sqnare inches. Snppose that American skill can produce ore of thirty-five inches in diemeter, we would then have a surface of 962 eqnere inchee, or nearly double thet of the Weshington telescope. If MR. LICK can get Clark to promiee a telescope of forty inches in diameter, it would equal 1,257 squere inchee. Either one of these instruments would collect more light—he more epace-penetrating—thsn that of Lord Rose. As to the cost, it would be difficult to eet a price on an instrument of this character, ae much would depend on the experiments with the glass. The Waehington telescope, whioh, hy the way, will ehortly be in working order, was to have cost $50,000, bnt it only cost abont $30,000. The reason of thie was that the experiments were very snccessfnl. It will take probably three years to complete a telescope snch es MR. LICK intends having constrncted.

MR. LICK has hed this object in view for some time, bnt with characteristic modeety has refreined from making it public, and it was only after considerable solicitetion that he allowed Professor Davidson to mention the matter. This action will make his neme known and remembered throughout the world for years to come ae a noted benefactor of ecience. The proposed obeervatory is not hie only gift to Science, for after giving the California Academy a valuable lot, it is probably his intention to erect the building es well. The Acedemy will no donbt become trnstee of the new obeervatory, and in future years the name of the California Acedemy of Science will be femous emong eimilar hodies thronghont the world. The neme of JAMES LICK, its noble benefactor, will be remembered by generations yet unborn, while the meed of praise will be ewerded to him by the whole Americen people. Californiene will be prond to eey "He was a Californian," and to know that their yonng State wee the home of a man who did more to foster hroad, enlightened viewe aud encourege scientifio reeearch in its highest branches then any other American has done. Nor does he wait nntil hie weelth is of no uee to him. No chence for probete troubles, graeping heire or mercenery lawyere. He give freely and munificently while in the flesh, end will see that hie wishes are cerried ont to the letter. All praise then to the generous donor, who bringe not only honor to himself, but to the State in which he resides. The observatory will be an everleeting monument, and ite founder's name go down to posterity amoug thoee of the great benefactors of his rece. In the fervent lenguage of Profeesor Davidson, "a thonsand yeare hence the name of JAMES LICK's observatory, endowed with perpetual growth, will continue to unfold the mysteries of the cosmos, and search for new worlds to conquer."

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIO PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., October 17th, 1873.

FOR WEEK ENDING OCTOBEN 7TH, 1873."

DEVICE FOR DETACHING HORSES.—Samnel Sykes, Portland, Oregon.

SHOE-FAETENING.—George L. Fitch and Henry M. Jonee, Little Lake, Cal.

ORE-STAMP.—Lewis D. Webh, Greenville, Cal.

BURIAL-CASE.—Jerome B. Cox, S. F., Cal.

SOFA-BENSTEAN.—Samnel M. Winn, and Sylveeter A. Winn, S. F., Cal.

HOEE-COUPLING.—Wells Kilburu, Napa, Cal.

REISSUE.

COMBINEN WATER-WHEEL AND SEWING MACHINE.—Isaac Hyde, aesignor to Oscar J. Backus.

———"The patents are not ready for delivery hy the Patent Office until soms 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than hy any other agency.

A REMEDY for emoky chimneye ie advertised in another column. The principle upon whioh this chimney top ie formed is to create an artificial draft. Six or more apertnres are so contructed at the mouth of the top ae to carry off the smoke from all sidee; a top cover ie fastened upon it to prevent air pressure from above. These chimney tops are quite ornamental and said to be very effeotive.

Mitchell's Patent Heater.

The accompanying cnt represents Mitchell's patent heater, which may be nsed for attaching to steam-tables, hot-closets, plate-warmers, tea and coffee tables, lanndries for washing and ironing, confectionery purposee, etc. It may also be nsed with the improved antomatie steam washer and rinser, and is adapted for heating schools and churches by water or steam. It can be set either in brick or made portable and bo nsed with wood or coal as desired. The arrangement of the heater is such that it is capable of driving a three-horse power engine for pumping, washing, making hntter, etc. The main object of the improvement is to concentrato the heat from the fire-place against tho top of the stove, so that the greatest possible benefit can ho derived from it before allowing it to eecape up tho stove-pipe.

The fireplaco inside of the stovo is made in the form of an open topped box, which is smaller than tho outside iron shell of the stove. The grato is placed in the usual manner. The sides of tho box-shaped fireplace, slope ontwardly toward the top, and extend upward to within a short distance of the top of the stovo-shell inside, whero the back and rear half of the two sides aro extended outward at a greater angle so as to meet the upper edges of the sides of the shell, thns leaving an opening on each sido at the front of the stovo, through which the products of combnstion will pass on their way to the draft pipe, which communicates with the space between the fireplace and stove shell at the back of the stove.

By constructing the stovo with only two side openings at the upper front of the stove, through which all the products of combustion mnst pass, all of the heat will neeessarily strike the top of tho stove before passing into the space or jacket between the box and shell, thus obtaining the greatest possible benefit from the heat. The heater can be attached either to a tank or common water boiler. If it is desired at any time to have steam for any purpose, the attachments shown can be used. In that case the lower cock on the pipes at the right of the drawing is closed entirely and the upper cock is opened sufficiently to allow a certain quantity of water to flow. An upright glass tube connectiog with this pipe, shown in the cut, indicates the hight of water in the coils aronnd the fireplace. By regulating the upper cock properly, just enongh water will flow into the fireplace, as the fire converts into steam. The glass tube enables one to see the hight of water and the little safety valve shown at the top of the pipe over the steam chamber, precludes the possibility of an explosion in ease the pipes were out of order. The steam collects in the little steam chamber, on the left of the stove, and may be led off in pipes for any purpose that may be desired.

If steam is not needed, the water is heated in the nsual way, and may be led over the honse to bath rooms, etc. Mr. J. H. Mitchell, recently patented the invention through the Scientifio Press Patent Agency. Arrangements have heen made with Messrs. Locke & Montagne, No. 112 Battery St., to mannfscture these heaters on this coast.

Academy of Sciences.

A very interesting meeting of the California Academy was held on Monday eveuing laet, and part of the proceedings at least, will be known all over the land. The proposed observatory in the Sierras will be one of world-wide benefit, and after its completion the proceedings of the Academy will probably attract as much attention as those of any other scientific body in the eonntry. The President's paper on "Spectrum Analysis," which we give in another column, will be read with interest, and the conclnsion more than hints at a great scientific work abont to be commenced.

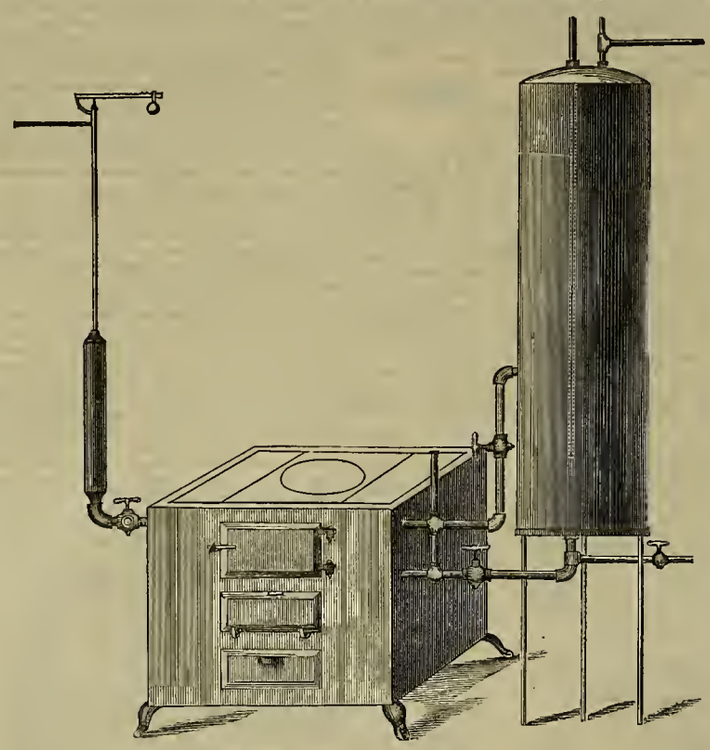
The following new members were elected at the last meeting: Andrew B. McCreary (life member), Dr. H. Behr, Wm. W. Russel, Isaac E. Davis, Philip Cadno, C. H. Whitesides and Stephen Powers (corresponding members). A large specimen of the devil fish (*octopus punctatus*), was presented by a member. Also a qnantity of minerals and ores from the Geysers and Clear Lake, together with petrified wood and bark from the petrified forest at Calistoga. A piece of charcoal, taken from one of the Rocky Mountain Coal Company's mines, was donated by D. D. Colton. The specimen was a very peculiar one. At the conclnsion of the President's paper on spectrnm analysis, Henry G. Hanks read a description of the spectroscope and the method of using it. He had a fine instrument in the room, and after adjournment gave illustrations with the spectroscope, which were of mnch interest to the members and visitors. We regret that want of space forbids our publishing Mr. Hanks' paper, which was very instructive.

Resume of the Experiments, Deductions and Application of Spectrum Analysis.

At the regular semi-monthly meeting of the California Academy of Science, held on Monday evening last, the President, Professor George Davidson, of the U. S. Coast Survey, read a paper on Spectrum analysis, giving a resnmé of the experiments, dednctions and application of spectrum analysis, which is of great general interest. The conclnsion, particnlarly, will be read with pleasure by all lovers of science, showing as it does that the marmoth observatory of the world, will shortly be erected by the mnnificence of ono of the members of the Academy—James Lick. The President's paper was as follows:

The new branch of astronomical science which the Spectrum Analysis has developed, rests upon the clearly established fact that matter having characteristics common to that of the earth, and subject to laws similar to those prevailing upon the earth, exists throughout stellar space; so that the laws of terrestrial physics are included among the other phenomena of cosmical bodies.

When solar light is directed throngh a prism of glass, it is dispersed into gradations of color which pass imperceptibly from one to another, but the seven principal groups are known as the prismatio colors, which we see exhibited in the rainbow. This colored image is termed the eolar spectrum; as viewed by Newton's method, it appears continnous; but as seen by the slit



A PATENT WATER HEATER.

introduced by Wollaston, it is interrnpted by almost innnmerable dark lines of different breadths and intensities, and apparently without regularity of distribution. But in reality each dark line maintains an almost invariable position, breadth and intensity with regard to all the others.

These dark lines, although carefully mapped, to the nnmber of 576, with the greatest precision, by Fraunhofer, remained a mystery, nntil Kirchoff, in 1859, discovered and annonnced their wonderful meaning. The brilliant experiments since made have been so numerous and well verified that the calculns of probabilities assures us that by the coincidence of only sixty of the hundreds of lines of iron, since verified, there are millions of millions of chances to one that the law announced by him is trne.

To readily understand this law and its resnlts, we must first state the characteristics of each of the the three orders of spectra.

I. The spectra of solid and liquid bodies are contiuuous, and embrace every shade of color.

All incandescent solid and liquid bodies—carbon, lime, platinum, magnesium, etc.,—emit white light whieh is dispersed by transmission through the prism into its colored components that succeed each other without the slightest interruption by dark lines. The limits of the individual colors are not sharply defined; they rather blend by infinitely small gradations one into the other, and thus form an unbroken and continuous spectrum which presents the same general appearance as the solar spectrum, although the various groups of color are not always distributed in exactly the same proportion in the spectra of different substances. According to the kind of light employed, sometimes the red group and sometimes the violet gronpe predominates; only in rare instances do incandescent snbstances emit, with any pre-eminent strength, and isolated set of colored rays, as in the case of the very rare substance, Erbia.

II. The spectra of glowing or luminous vapors or gases exhibit series of distinct, sharply defined, bright colored lines or bands separated from each other by dark spaces.

These brilliant lines are "the handwriting on the wall" by which Kirchhoff so completely interpreted the marvellous story which the dark lines of the solar and stellar spectra held concealed. They will be exhibited to you to-night: each element has its particular lino or lines, apparently irregularly arranged and exhibiting a want of continuity or blending in the succession of the colors, but of invariable color or colors, breadths and position, and holding a constant relation notonly to similar spectra of all other snbstances, bnt to the dark lines of the solar and stellar spectra.

Hence, simple substances glowing in a state of gas may be nnerringly distinguished from each other by their spectra; and every compound substance or alloy that can become luminous in the gaseons state, without suffering decomposition, is distinguished by the bright lines of the two or more metals forming the compound; but the characteristio line or lines of each hold their invariable colors and position as if each metal was separately incandescent. Thus, when brass is heated to luminosity, we have exhibited a magnificent bnt discontinnous spectrum in which the red line and three blue lines of the zinc, and the three green bands of the copper appear. But the compounds of such metals as sodium, calcinm, etc. —for example, chloride of sodinm, nitrate of lime, etc—do not exhibit the spectra of both elements. The spectra of the vapors of the metals alone appear; why the spectra of the nonmetallic elements with which they are in combination do not appear, is not yet explained.

From this statement of the conditions attending the non-continuous spectrum, or spectrum of bright lines, or gas spectrum, as it is variously designated, it is obvious that if the group of lines characterizing the different terrestrial substances be known, a comparison of these, as standard spectra, with the spectrum of light from an unknown source will determine whether any of these terrestrial substances exist in the source of that light.

III. The spectra of incandescent solid or liquid bodies surrounded by an atmosphere of lower temperature, containing (on account of the extreme heat of the nucleus) the vapors of many or all of the substances of which the bodies are composed, are colored bands, in which the continuity of the light is broken by dark lines.

Without the use of the slit, through which the light is admitted, these dark lines are not visible. The aperture which Newton used prevented further discovery for many years, and upon so trifling a device do great advances in knowledge frequently hinge.

In the spectrum from any given incandescent body, the number, breadth, intensity and position of the dark lines, are invariable if the body be unchanging, or not receding and approaching the observer, and if viewed by prisms of the same dispersive power.

These dark lines are not produced directly by the souree of the light, bnt they specify the vapors through which that light has passed, and which have, by absorption, neutralized certain definite colors or rates of vibration of the light.

These spectra are formed by the light of the snn and the stars; and the dark lines, amid so much light, are the mysterions symbols which Kirchoff so completely interpreted by the brilliant spectra of the luminous vapors or gases.

Having as compactly as practicable stated these three orders of spectra, let us briefly recount the nniqne experiments of Kirchhoff in their logical sequence and deduction.

It had been remarked by Fraunhofer that the position of the two dark lines in the solar spectrum, designated by him D, were coincident with the two bright yellow lines shown by the light of a lamp, now known as the sodinm lines. To pnt this coinoidence to the most direct test Kirchhoff obtained a tolerably bright solar spectrnm, and then bronght the sodinm flame in front of the slit of the spectroscope. The dark lines instantly changed into bright ones of unexpected brilliancy. In order to ascertain how far the intensity of the solar spectrnm conld be increased without impairing the distinctness of the sodium lines, he allowed direct sun-light to pass through the sodinm flame before falling npon the slit of the spectroscope, and saw the dark lines, D, corresponding to the sodinm lines, stand ont with extraordinary clearness. Sunlight was then replaced by the Drnmmond light, the spectrum of which, as of every other incandesent solid or liquid body, contains no dark lines, and when the salt flame was interposed, the dark lines, D, again appeared. Similar resnlts were reached when platinnm wire waa bronght nearly to its melting point. These were the most wonderfnl experiments of this century, and fortunately for science, Kirchhoff was equal to the task of following them to their logical conclusion. He conld no longer doubt that the existence of the dark lines, D, in the solar spectrnm was due to the presence of vapor of sodinm in the sun's atmosphere, and that they mnst be produced by the absorption or nentralizing of the sodinm spectrnm of the snn's nucleus in a manner similar to that shown in the foregoing experiments.

He then commenced the laborious undertaking of comparing the spectra of numerous terrestrial substances to determine whether any and which of the bright-colored spectrum lines of the substances coincided with the dark lines of the solar spectrum. To do this he allowed the light of the sun to fall directly into the spectroscope upon the first large prism, through the lower half of the slit, whilst the upper half was covered by the small priem for comparison. The rays from an artificial source of light placed at the side were then reflected by this prism into the instrument, so that whilst the solar spectrum, with its dark lines, was seen in the upper half of the field of view in the (inverting) telescope, there appeared below, and in immediate contact with it, the spectrum of the artificial light. [Illnstrated on blackboard.]

In this manner of experimenting the positions of the bright lines of this spectrum could be compared with great accuracy with those of the dark lines of the solar spectrum. By these and many other comparisons, Kirchhoff arrived at the surprising result that the bright lines of several metals were entirely coincident with the same number of dark lines in the solar spectrnm. Even in the part of the spectrum first published by Kirchhoff, there are some sixty bright lines of iron, all of which coincide accurately with as many dark lines of the solar spectrum.

The complete coincidence of so many bright lines in the spectrum of one and the same substance with the same nnmber of dark lines of the solar spectrnm, shows conclusively that it cannot be the effect of chance, but justifies the deduction that those dark lines are to be ascribed to the absorption or neutralizing effect of the vapor of iron present in the vapor of the sun, and that the metallic iron was incandescent in the body of the sun. The likelihood that such a coincidence of only sixty lines is a mere chance, bears a proportion to the snpposition that these lines really make known the presence of iron vapor in the snn's atmosphere, according to the law of probabilities, of one to a million of millions of millions. These experiments, confirmed by mathematical law, were seized by the comprehensive grasp of Kirchhoff and reduced to a general physical law, embracing all that had been done and what has since been accomplished.

This law he enunciated in the celebrated sentence: "The relation between the power of emission and the power of absorption of one and the same class of rays, is the same for all bodies at the same temperature."

Angström in 1853, Foucault in 1849, and Euler a century earlier, had expressed nearly the same priuciple from isolated and uncorrelated facts.

The continnation of the experiments by Hofmann, gave thirteen additional very striking coincidences, and Angström and Thalén, who volatilized iron in the electric arc, fonnd coincidences of more than 460 bright lines of the iron spectrum with an equal number of the dark lines.

The most striking coincidence between the bright spectrum lines of terrestrial elements and the dark lines of the solar spectrum are also exhibited by potassinm, calcicum, magnesium, manganese, chromium, nickel, hydrogen, titanium, etc. The spectrum lines of these substances not only agree exactly with the dark lines in position and breadth, but proclaim their relationship by a similar degree of intensity. The brightor, for instance, a spectrum line appears, so much darker does its corresponding line show in the solar spectrum. Thalén's ipvestigationa extend over 45 metala,

(Continued on page 268)

American Mines and British Owners.

A correspondent of the London *Mining Journal*, writee as follows to tbat paper:

History, we are told, repeats itself; so does the fluctuation (only with far greater frequency) in price of the useful metals of commerce, notable amongst wbich may he mentioned those of tin and copper. It will he no sufficient counterpoise to this fact to allege that mines of gold and silver are lese permanent and reliahle in their general characler than are those of the common metals, hecauee no sncb position can be established. The erratic character of some of the limestone formations, aud tbe capriciousnees of their produce, merely apply to such individual formatione, and do not extend to minee of gold aud silver in most of the other classes of rocks. There can be but little, if any, douht tbat foreigu mining has heen largely prejudiced from time to time by the promoters basing their calculations ae to tbe future from eccentricities of the moment, and which were but superficially outliued. If the same kind of husiness acumien had heen exercised in the selection and purchase of miues in the Western States of America as is usually done in respect of other enterprises, mining in those States would now be as popular as to many individuale it is repuleive; and instead of bewailing their misfortunes and losses, those interested would be jubilant in their success and prosperity. The history of mining throughout tbe world goes to show that no mine, in whatever country or in what manner soever it may have heen worked, wbetber by slave or free lahour, was ever worth 1,000,000*l.* sterling. Foreign as well as home mines, to become succesfnl and satisfactory investments, must he purchaeed at reasonable rates, as well as subsequently worked on tbe soundest principles of ecouomy. That foreign miues, as a rule, are very much richer tban those of European countries no one, I think, would tske upon bimself to dispute; yet it cannot he denied but that mines as poor—or sections of ground miscalled mines—as those of any European country may he eubstituted, with certaiu decoratioue, for good minee, and as such may he regarded and worked for comparatively lengtby periods, to the great discredit aud loss of mining. The past ought to be a sufficient warning, at least for tbe present, against heedless speculations. Rushing into investments with an impetuosity akin to that with which people excited hy the prospect of imminent danger usually run tberefrom may he in consouance with the times, hut appears to he sadly at variance witb sound common sense.

Ou visiting London soon after my 'return from Nevada, about nine months siuce, and in conversation with a gentleman there respecting a large silver mining property which I owned in Nevada, and was desirous of baving it worked on lease, I was somewhat surprised on bearing him remark that "he feared the comparatively small amount of capital required would give it a correspondingly emall appsarance in the estimation of the investing public, and make it appear as too little a thing to attract any notice in these fast times." I could hut uot deplore a condition of things wbich gave rise to such a remark, and deeply regretted that a community which had heretofore maintained a universal reputation for prudeuce sbould for even the briefest period he found oommitted to sensationalism. I was also informed hy more than one individual that their decided opinion was that no company could be formed in Londou to furnisb the uecessary funds to work a miue on lease, however assnring its prospecte migbt he. What will the output of your mine be per day, and of wbat value and at what cost per ton, and what will he tbe profits? Satisfactory answers will he required to all these questions, aud subsequently confirmed by some expert popularly known in London. Would it be out of place to say here that men were reputed expert in this business of miniug who know nothing whatever themselves conceruing it, and wbose sole information was derived from newspapers and hooks, and tbe siftiug of working miners and others who might he found verdant enough to afford tbem any information? But is to he hoped that the past is past and done witb, except for reference analogically for future guidauce. The best use which can he made of errors which cannot he recalled is to erect them as heacons to guard against tbeir recurrence in future timee.

The euccess of mining, like that of every other euterprise, depends as much ou the first as on current costs, and upon either or both, as upon tbe gross revenue of its developed resources. However rich mines may be, the pecuniary euccees of tbe ownere ie derived from the proper adaptation of means to tbe end. The resources of rich mines, like those of individuals, may he frittered away to little or no purpose. It needs only iuatteution to the avenues through whicb wealth circulates, and such channels become increasiugly wide, uutil the streams hy indefinite expansion hecome more aud more attenuated, until tbey suhside eventually in utter dissipation. To look upon mining as some evidently do, as a speculation akin to gamhling, may he a very convenient, but I am sure an equally improper way of regardiug it. Tbere ie, however, a feature common to botb which has very much to do witb their snccese, aud that is experience, and it shonld never be forgotten that the most epecious pretenaious of the most plausible theoriste can uever supercede practical experienae. Itie a matter of great importauce to this country whether milliene sterling are gained or lost by foreign euterprises. There is an immense difference whether money in mining is successfully spent in tbe country or out of it, as, in the oue case, considerable revenue may accrue to the country at large by the development and increase of its material wealth, whilst at tbo same time considerable losseemay he entailed upon industrial adventures. But if English capital is unsuccessfully spent in developing the resources of other countries, whatever the amount may be, it ie au entire loss to this country, because no equivalent in material valne bas been rendered in exchange therefor, and tbe money thue expended, instead of passing from one persou to another in this country, has passed out of it.

Tbe rigid observance of abstract or arhitrary notions by one party in business affords the other party an opportunity to concert measures to circumvent thom.

So soon as it hecame known that highly-spiced minea were hest relished, and most acceptable to moneyed parties in England, steps were immediately taken to prepare and preseut the article most agreeable to the taste. Exactly what wae required for the coming and, submitted witb great apparent liberality and candor, which, unfortunately, was esteemed as being highly commendable, as well of the mines as tbe parties recommending them. Whenever it hecomes known in what direction a person's proclivities tend in business it ie generally an easy matter for the opposite parties to secure all the advantages on tbeir side, aud mining is no exception to other pursuits in this respect, and, therefore, laxity in any of ite different parts, whetber in its practical working or its financial arrangements, can no more fail of being attended by ill consequences than can any other enterprise, many of which do not envolve such multifarious details as mining, every part of whicb in its healthy and proper working is vital and indispensihle to tbe proper working and futl success of the whole.

Gold Movements.

We have more than once alluded to a peculiarity in the gold movements of the present year which appears to us moet significant, namely, the unusual proporlion of the imporl from tbe uou-producing countriee. This is, we believe, an unmistakable sign of the exhaustion of the stocks of gold throughout the world, and corroboratee the evideuce of exhaustion furnished by otber facts, such as the monetary panic in South America. Tbe whole subject has now become so important that we think it will be useful to extract in full, from the Bosrd of Trade returns for last montb, tbe accouut of our gold imports for eight months of the present year then past, as compared with the corresponding eigbt montbs of 1872 and 1871:

	1871.	1872.	1873.
Russia	£415,463	£38,300	.....
Germany	856,569	160,423	£43,133
Holland	11,705	8,009	7,353
Belgium	495,583	233,355	7,500
France	135,217	441,383	411,749
Portugal, Azores and Madeira	.....	1,500	.....
Spain and Canar'a	4,004	9,260	18,947
Gibraltar	88,600	36,597	50,525
Malta	97,756	67,683	68,880
Turkey	28,961	700	7,340
Egypt	41,937	5,912	1,067,942
West Coast Africa	95,992	67,139	61,687
BritishPossessons in South Africa	200	200	1,460
China, including Hougkong	1,500	.....	65,816
Australia	4,625,142	4,082,831	6,215,549
British N. Amer'a	370,224	35,000	2,756
Mexico, S. America (except Brazil) and West Indies	790,695	442,458	1,649,802
Brazil	129,256	83,966	37,846
United States	6,377,458	7,187,681	3,111,147
Other countries	366,060	114,580	205,555
Total	£14,855,311	£13,021,184	£13,015,907

It will he eeen from tbie tbat, although we have this year imported ae much as in 1872, tbe eources of supply have been very different. In the first eight months of 1872 we received—

From Australia	£ 4,083,000
From America	7,188,000
Total	£11,271,000

and less tban £2,000,000 from all tbe rest of the work beeides; hut this year we have received:

From Australia	£ 6,216,000
From America	3,111,000
Total	£ 9,327,000

—the receipts from otber parts of the world heing nearly $4,000,000. Analyzing the account still further, we find that this year we have received £1,068,000 from Egypt, a country which doee not produce gold, and which we usually supply, and £1,650,000 from Soutb America, Mexico and the West Indies, chiefly, we believe from South America—as compared witb much smaller imports from these couutries in 1871 aud 1872. Another peculiarity in the return, it will be noticed, is that the direct supply from Russia has wholly ceased, and that this year tbere have also heen no imports at all from the coutinent, in spite of the high rates of discount prevailing at oue time here, althoug as late as 1871 we imported more than £1,300,000 from France and Germany. The largest increase of supply from Australia aud decrease of tbe aupply from America are also remarkable, the explanation, we helieve, being that the American demand for gold, owiug to the peculiarities of the American bauking law, has iucreased, and that, stocks being small, tbe curreut supplies have been used to replenish them; while Australia, as the effect of the high rate of intereet, has eent us all her exports directly, no part of them being diverted at Galle for India and the East, as happens in some years. As it is, however, Australian stocks have apparently heen drawn upon also, and the excessive import from Australia during the present year rather diminishee the probability of our receiving so much in another year, unlese the produciug capacity of the mines sbould he greatly increased.—*London Economist.*

Chemicals in Pan Amalgamation.

The following article appears in the last Report of the United States Mining Commissioner.

The attention of the mining puhlic has, witbin late yeare, been largely attracted to the existenco of uumerous veins aud deposits of eilver ore, the beneficiation of wbich was, however, apparently impracticahle, as the ores they furnish canuot be worked with auy degree of success hy the ordinary amalgamatien process, and are not sufficiently rich to bear the expense of roasting, even after the improved aud cbeaper methods now in vogue. An over-confidence in the adaptahility of the ordinary Washoe process to tbe workiug of ores of the most different characters has led to numerous failures, wbile, on the other hand, tbe caution bred of experience causes many properties to lie idle which would prove remunerative under a method of treatment equal in thoroughness to the ordinary process, without greatly exceeding it in expense. The demand for sucb a process hae within the last three years heeu practically filled, hut the suspicion witb which all innovations are regarded, and tbe uninvestigative spirit of the "practical" millman, have preveuted this new mcthod from heiug more generally known and adopted. Tbe facts now set forth should demonstrate its usefulness heyond a question. A test of its merits cau he readily made. Simple ae it appears, it can he made to solve many metallurgical and financial problems in tbe way of working ores to a fair percentage of their value, and with profit, wbich hitherto have, by tbeir apparent rebelliouenese, proven only sources of loss.

Tbe first successful attempt at amalgamatiug rehellious silver-minerals in pans, and without roasting, was made on the Comstock slimes. By far the greater portion of these slimes was in former years allowed to run to waste. This loss was probahly looked upon as an evil unavoidahle in wet-crushing mills, and was partially excused by tbe fact that not more than 35 per cent. of their gross valuo could he extracted hy the then known methods of treatment. Tbere wae consequently but little inducement to millmen to save slimes assaying $40 per ton, or thereahout, as they could harely be worked to a profit. Thonsande of tons were thus lost, whicb at the present day would yield an enormous fortune to tbeir owner.

Some three years ago a series of experiments were made, wbich clearly proved that these slimes could he worked to a bigh perceutage at a cost whicb, tbough greater tban tbat of ordinary milling, still left a good margiu for profit. Mill-owners were induced to savo aud sell what they had hitherto allowed to rnn to waste, and, sbortly after, the working of slimes becsme a distinct feature of milling on the Comstock.

All tbis was effected simply by adapting to the Wasboe pan-process certain featnres of the Mexican patio, namely, the nse of sulphate of copper aud salt in sufficient quantities to decompose the rehellious silver-minerals and leave tbem in a favorable state for amalgamation. The successful application of these cbemicale to the ordinary Washoe process was entirely novel. It is true that in former years many millmen had tried these cbemicals amoug a host of otbers, but their experimente were invariahly carried ou with sucb a want of knowledge that failure was inevitable. Some used bluestone without salt, and others salt without bluestone. When the two were used eimultaneously, the amount was so small that the effect could not be appreciated. At the time referred to it was a maxim among millmen that no benefit was to he derived from tbe use of chemicals. Mr. Kuslel, in his hook on the Washoe process, after giving a list of the different chemicals employed or recommended—noue of which were probahly ever largely adopted—expresses strong doubls ae to the efficacy of any or all chemicals; and in a later article, after admitting the extraordinary effecte obtained on slimes, etates that the same process would not be applicahle to sands. So much to vindicate the practical originality of this process. It will he shown further on that it can he applied witb equal advaulage to the working of sands and tailings. Tbere is uo certainty as to the formulæ in obedience to wbich tbe chloride of copper—wbich is formed by the mutual action of salt and eulpbate of copper—effects its purpose. Chemists are not agreed as to tbe various re-actions, aud the subject is still under diepute. Its theoretical comprehension is, however, not essential to the practical operations which will be described.

We will first consider the application of chloride of copper to tbe working of slimes, and, later its extension to the treatment of sande or pulp.

[To bc continued.]

The San Diego *Union* says: The exteusion of tbe Ready Relief and the Hubert mill bas been sold to Mattison and Woodruff, of Juliau, for some $11,000. Those gentlemen intend to put ou a full shifl of hands to finisb their tuunel to the lodge, and are refittiug lheir mill, wbicb is a forty-foot overshot wheel.

Singularly enough, the *Iron Age* argues that paper is to hecome tbe general, if not uuiversal substitute for wool, leather and india ruhber, ae also, to some extent, for copper, tin, and zinc, aud that eveu iron is not adopted to usss so widely variouе—it being practicahle, indeed, to bring paper pulp to such a state of toughness and solidity, by pressure as to he almost as fire proof and indestrnctible as iron, and thus our railroad cars may be made of paper, instead of iron, thereby preventing tbe dangere now incurred in case of accidents. It is claimed tbat, iu proportion to ite weight, paper is, probably, the strongest material of construction known, combiniug more perfectly than any other substance tbe qualilies of strength, lightness, flexihility, durability, and cbeapness. So many and various, too, are the articles which can he made, tbat it can he manufactured in quantities practically unlimited in every civilized country, and, as long as plants continue to grow, paper manufacture will be eustaiued. It is, also, under all circumstances, an easy material to work and handle. The fact is probably well kuown that the paper wheels which have been used wilh success on some of the palace-cars are formed of compressed paper fitted into a steel tire; iron platea are then adapted to each side of the paper, and holted together to prevent any displacement of the filling.

New Mines.—The Visalia *Delta* states tbst Vicalia was tbrown into quite a furor of excitement by tbe return of several of the citizens from the region of the new mines. They report tbe regiou to he up to the main hranch of tbe Kaweab river, and about sixty miles in a south-easterly direction from tbie place. They report quite a numher of prospectora ou the gronnd, aud a numher of valnable ledges discovered. Some specimens exbibited show free gold in considerable qnantity. There are also indications of silver, copper and lead; the latter, perhaps, in the greatest ahundance. The lodos are said to be large, and some of them would he easily worked. Several companies have been formed, and further proceedings are heing discussed. Already tbe aharps are talking of building a town up there, and making a road. We are likely to have lively times in consequeuce, at the openiug of the spring Some talk of making another trip, though the season for work has passed, and tbe dangers of winter are near.

Australian Goln.— Tbe value of the gold imporied from the Australian Colonire has increased this year to a rather sensible extent, the value of tbe receipts to August 31st being estimated at £6,215,649, as compared with £4,082,731 iu 1872, and £4,625,142 in 1871. In these totals the month of Augnst in each year figured for £1,040,737, £571,122, and £570,089, respectively. Queensland is now producing gold at the rate of 210,000 ouuces per annum. Quartz reefs at Yam Creek, 90 miles south of Port Darwin, in the nortbern territory of South Australia, are spokeu of as rich. The gold fields of Auckland, New Zealand, have presented an improvement of late. The Hellver diggings, in Tasmauia, have heen almost deserted, owing to stormy weather. A rich discovery ie said, however, to have been made ou Bullock Creek, at tbe hack of the Malahide estate, in the district of Fiugal, Tasmania.—*London Times, September 28th.*

A Valuable Invention not Patenten.—The cheapest, most simple, aud practical fire-alarm for ordinary household purposes is a small weight of lead or iron made to adhere to the ceiling of each room with a piece of wax. When the temperature hecomes elevated above that of the ordiuary atmosphere, the wax will lose its adhesiveness and allow tbe weight to drop. The weigbt can he attached by a wire to all the bells in tbe house, or to sound any alarm extemporized for the purpose. The weights should be kept away from stove-pipes and out of the sun, and one should be placed in eacb room and ballway. They will not fail to give the alarm when tbere is an excessive increase of temperature, and no bouse should be with out them. This alarm ie not patented, and is free to be used by all witbout money and without price.—*Manufacturer and Builder.*

Fluming Enterprise.—The Fresno *Expositor* has tbe annexed: We areiuformed upon raliable autbority, that tbe fluming enterprise we noticed some weeks ago, is now being put into practical operation; and tbat the work of grading has already commenced; tbe survey having heen finisbed from the mouutains to tbe plains. The difficulty in relation to the water righte of Big Creek having heen amicably settled hetween the old and new claimauts, it is the intention of the proprietors to get all possible work done at the head of the works—to get tbe sawmill in full operation by spring—and by the opening of summer, to bave a sufficient supply of lumber on hand to meet the demands of the community, furnisbing a superior article at a more reasonable rate than is now possihle. We wish the enterprise all succese.

Frequently tbe surface of car-wheels blietere just uuder tbe chilled coating, or about three-sixteentbs of an iuch from tbe surface. Tbe scale of chilled coating breaks off in a ahort time, leaving a flat place on the wheel. Tbe angle of this flat surface strikes the rail precisely as a hammer would strike it, and iu the case of a heavily loaded car, running at a rapid speed, the force of tbe blow ie sufficient to break any except tbe strongeet of rails.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

15v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.

Mess. Shanley.....Hoosac Tunnel, Mass.

J. Dutton Steele.....Nesquehoning Tunnel, Pa.

Sidney Dillon.....Fourth Avenue Work, N. Y.

Col. Roebling.....East River Bridge Company, N. Y.

and fnlly confirm tbe observations of Kirchhoff and other eqnally able experimenters.

Tbe conception of this law of the interrelation of the spectra of tbe different orders enabled Kirchhoff to arrive at a new theory of the physicsl constitntion of tbe sun, which he regsrded as consisting of a solid or psrtially liqnid nuclens in the highest stste of incandescence, and emittiug, as do all incandescent solid or liquid bodies, every possible variety of light. Snch a body would of itself give a continned spectrum, witbout any dsrk lines, bnt this incandescent body is snrrounded by an atmosphere of lower temperature, containing the lnminons vapors of msny or all of the substances of which the body of the snn is composed. The rays of light emitted by the incandescent body mnst therefore pass through that atmosphere to reach tbe earth, and in that passage each vapor neutralizes, extinguishes or absorbs from the white light of the body those rays wbich it wonld itself emit when in a glowing state.

It is evident from this statement that if we conld obliterate the light from the snn's nnclens, and receive in the spectroscope only that of the luminous vapors of its atmosphere, a componnd spectrum wonld be obtained composed of the actnal spectra of the gases or vapors; in other words, the solar spectrnm wonld not appear, and bright-colored lines wonld be seen in the exact places of the dark lines of the solar spectrum. Fortunately, the occnrrence of a total solar eclipse affords an opportnnity of applying a crucial test to this tbeory of Kirchhoff, because in tbat phenomenon the snn's disk is for a short time completely bidden by the interposition of the moon, and all light from tbe snn's body intercepted, whilst the light from the glowing vapors of the snn's atmosphere is alone received. The observed resnlts have verified tbe dednction, and dnring the total solar eclipse of 1870, Professor Yonng saw all the dark, or Fraunhofer lines reversed or bright; the moment of obscuration, and for one or two seconds later, the field of the instrnment was filled witb the bright, colored lines of non-continuous spectra on a dark grownd.

This gasoons envelope of tbe sun yielding tbe non-continuons spectrum of colored bright lines has received the name of chromosphere. Under the chromospbere lies tbe lnminous, cloud-like vaporons, or nebulous photosphere, which contains all the snbstances of which the specturum lines appear as absorption lines in the solar spectrum. These substances — among which iron, magnesinm, and sodium are especially prominent—often burst forth in a state of incandescence, and are carried np to a certain beight into the chromosphere and into the bases of prominences, or sun-flames, thongh uot in general to any considerable elevation.

I have not time to even mention the many wonderful results which have been derived from observationa npon the snn spots, the flames, etc.; and can only briefly advert to what has been done in stellar investigations by means of the spectroscope.

Before its use, the stars had been believed to be snns, each snrrounded by a dependent gronp of planets; but this opinion rested only upon a possible analogy with onr own system; for the pecnliar constitution of these points of light in space, and of wbat snbstances they are composed, the nnassisted telescope has yielded no information. In the largest instruments the stars remain diskless, and appear simply as relatively brilliant points of light. By adding tbe spectroscope to the telescope we secure tbe means of reading in the light emitted by these heavenly bodies, not only the indications of their trne nature and physical constitntion, but wbither and how rapidly they are moving throngh space. By this combination of instruments we now have telegraphic communication with every solar system, for the spectrum lines are the cosmical alphabet of which we possess the terrestrial key.

Tbe spectra of the stars are analogous to tbe solar spectrnm, being continnous and crosed by black lines, which have been compared with tbe bright-colored lines of terrestrial substances, volatilized in the electric spark; and the complete coincidence of the cbaracteristic bright lines with the same number of dark lines in the stellar spectrum justifies the conclnsion that the substances giving these bright lines are present as glowing vapor in the atmospheres of the stars.

In tb brilliant spectra of *alpha* Tauri and *alpha* Orionis, the positions of about eighty dark lines, lying in that part of each spectrum between the Frannhofer lines, C and F, have been accurately and repeatedly measured by Huggins and Miller, and are exhibited in the large illustrationa. These measured lines, are however, bnt a few of the innnmerable fine lines which are visible in the spectra of these stars. As in the experiments with the solar spectrum, these spectra of terrestrial elements are made to appear in the spectroscope as bright lines npon a dark baokground exactly in justaxposition with the spectrum of the star, so that it can be determiued with the greatest accnracy whether these bright lines are co-incident with the dark lines of the star.

Wbilst the faintness of the stellar light as received by the best instrnments for such iovestigations, limits the comparison to the stronger lines of each terrestrial snbstance, yet the certainty of their presence in the stars does not rest npon the the coincidence of one line, but upon the coinoidence of groups of two three or more lines, in different parts of tbe spectrum; and we can apply the oalonlus of probabilities to thesecsses as is done to the observations of the coincidences of the solar spectrnm.

Notwithstanding the stars have a physical constitntion similsr to that of the snn, tbere is a grest differeuce in tbe constitution of individual stsrs. Tbe groupings of tbe vsrious lines wbicb indicate the presence of certain elements is peculiar and cbarscteristic for each stsr; generally speaking, we may say thst in the white stars the spectrum is sometimes crossed by very numerons and mostly very fine, dark lines, but always by four broad and very dark liues, dne to the presence of bydrogen. These brosd, dsrk lines seem to indicate that the absorptive atmosphere of these stars mnst be very tbick, nnder considerable pressnre, and at a very high temperature. Tbe yellow, red and blue stars bave also their peculiar characteristics. Tbe constitution of the variable stars remains yet nnexplained. The new or temporary stars exbibit a compound spectrnm, wherein, it is snpposed, that one is the nsnal stellar spectrum upon which is snperposed tbe spectrum of bright lines, which, from their great brilliancy, stand in bold relief npon the fainter, darker backgronnd of the former. This latter fact indicates the presence—possibly the combustion — of an intensely luminons gas. Tbe drawing gives a good idea of this effect in the star *tau* Coronæ, which, in May, 1866, snddenly increased in brilliancy from tbe eighth to tbe seoond magnitnde; and gradnally subsided to its former condition.

Besides learning this and much more of the physical constitntions of the stars, the spectroscope affords the means of measuring their rate of proper motion tbrough space. As the position of the spectrnm lines depends upon their wave length, it is readily nnderstood that the displacement of any one of the lines, toward the violet for instance, will indicate that tbe wave length of tbe ether causing that particular line has been shortened in its passage to the earth, and therefore the star is approaching ns. On tbe contrary, a displacement of the ssme line towards the red will indicate tbat the ether waves bave lengthencd, and that the star is receding from ns. By observation and calculation the rate is dednced. Sirius is approaching the snn at the rate of twenty-six miles a second; Arcturus, fifty miles; Vega and *alpha* Cygni, Pollux and *alpha* Ursæ Majoris, witb velocities varying from forty to sixty miles. Rigel, Castor, Regulns and many stars of the Great Bear are moving away from us.

By a modification and special application of the spectroscope, we will procnre more certain results concerning the time of rotation of the sun on its axis.

Tbe spectroscope has also partially revealed the nature of the light of comets, so that we may assert that at least the nucleus is partially self-lnminous, and is composed of gas in a luminous condition; whilst tbe continuous spectrnm proves that the light of tbe tail and some of the light of tbe coma is reflected sunlight. Tbese resnlts are from observations upon small, faint comets; tbe appearance of a large, brilliant comet will afford much better means of ascertaining their pbysical constitution.

Of the pure nebulæ composed of cosmical matter in which there is no ceutral point of condeusation, and whicb has not become sufficiently dense to form a celestial body, in the ordinary sense of that term, the spectroscope gives a spectrum of bright lines, indicating the presence of volnmes of lnminous gas, of wbich nitrogen and hydrogen form the cbief constituents, which exist nnder sligbt pressure and at a low temperature, in comparison with tbat of the sun. The observations of this class of heavenly bodies, as of comets, are extremely difficult with the present instrnmental means. Tbe largest telescopes had failed to solve tbe question whetber tbe unresolved nebulæ are portions of primeval matter; but with the spectroscope as an adjunct, we can now say with certainty tbat luminons nebulæ actnally exist in space as isolated volumes of glowing gas. More astonishing still, by observations npon large numbers of pure nebnlæ in many forms, we are able to study the phases througb wbich our snn and planets have passed in their process of development from similar matter,

This instrnment has revealed a part of the physical history of the meteors. It is unraveling the nature of lightning. It has given a spectrum of the Aurora Borealis not coincident with any of the known spectra of gases of our atmosphere, because it is of an order that has not yet been artificially produced.

It has shown that the planets shine by reflected light, because we receive from them the solar spectrnm. The results of different observers agree in establishing the complete accordance of the lunar spectrum with that of the sun; and from this entire absence of any special absorption lines it must be concluded that there is no atmosphere aronnd tbe moon. Satnrn, Jupiter, Mars and Venus afford evidence of an atmosphere containing aqueons vapors. The spectrum of Uranns is very remarkable, and the physicist has been compelled to ask whether the planet is self-luminous, and whether it has attained that degree of condensation and development possessed by the earth and the nearer planets. The feebleness of its light renders observetions difficult and comparatively nndecided. The spectrnm of Neptune bears a strong resemblance to that of Uranus. A peculiar interest attaches to this spectrnm from the coincidence of the dark bands with the bright lines of certain comets and with the dark bands of the stars of Secchi's fonrth type, wherein the spectra besrs a very close resemblance to the spectrum of carbon.

Notwithstanding the high thougbts with which these discoveries fill ns, and the suggestions they force upon the mind, there are other results tbst come directly home to the capitalist, the jurist, the physician, the chemist, the workman. With one or two illustrations, I must close this already too extended resume.

Millions of dollars are invested in Europe and America in tbe production of cast-steel by the Bessemer process. The proces s of conversion is one of anch extreme delicacy tbst s mistake of ten seconds before or after the instant when tbe carbon is consnmed, ruins the five tons of each melting. Even with the most skilled workman watching tbe appearance of tbe flame issuing from the mouth of the converting vessel, the average loss was one melting in three; bnt by tbe application of tbe spectroscope to the luminous vapor rising from the incandescent iron and its impurities, the changes in the vividly bright liues of the gas spectrum are watched, and at tbe moment when the carbon spectrum disappears the combustion is stopped, and the production of steel by tbat melting assnred.

In medicine the spectroscope has been employed to determine what time various substances reqnire for absorption by different parts of the body; the nature of cataract; and the character of bloodstains. A bloodstain so small that it contains only 1-1000 part of a grain is perfectly easy of detection, and has been recognized in stains after a period of fifty years. When we recollect that the eighteen-millionth of a grain of sodium, the six-millionth of a grain of lithium, the one-millionth of a grain of strontinm, etc., yield their inevitable spectra, it is readily foreseen how tbe presence of poisons in the human body can be made known, as has already been done in cases of poisoning by cbarcoal fumes. It will open new views upon the curative energy of drugs, when we correlate the wave motions of the ether excited by one or more of their elements with the lifewave motions of tbe ether propagated tbrough nerves and brain.

It immeasurably extends the field of chemical analysis, and has made us acquainted witb four new metals previously nnsuspected, and the universality of otbers.

Spectrum analysis is in its infancy, as tbe telescope was in the hands of Galileo, and to predict an equally great advanoe within this centnry will not be rash. It dawned when Newton decomposed solar light; the sun appeared on the horizon when Fraunbofer mapped the fine, dark lines, and Kirchhoff revealed the glory of tbe risen sun.

With a telescope of tbe largest size and most consummate workmansbip that American skill can devise, properly located ten thousand feet above the sea in the clear skies of the Sierra Nevada; with every variety of apparatus commensurate therewith; with masters of observation and ingenuity in researcb; with ample funds reserved to devise other instruments and methods which those instrnments and tbe bigbest genius must suggest, we hope at no distant day to see solved tbe migbty problems of croation that are yet beyond onr grasp.

Sucb an outfit, and such provision, have been the life-long objects of James Lick; and after mnob earnest solicitation, I have overcome his shrinking from what he considers vain-glory, and obtained his permission to announce to tbe Academy his intentions, which I have faintly sketched in the preceding sentence. There will be no let or hinderauce in carrying out his views; the amplest means are provided; the rarest skill bas been invoked; and the plans are taking definite and practical shape.

In tbe many conferrences whicb I have had with him, I have been deeply impressed witb the breadth and practicability of bis views in the futnre of original research in cosmical physics, and of his deep patriotism that would have America lead in the sublimest science. Much would I like to tell you of his mnnificent plans, of his modesty as great, and of the deptb of human nature in bis soul, bnt be bas placed a seal npon my lips. The Academy and the Pioneers may at no distant day have again to tbank him for means to erect their buildings; whilst tbe former may become the frustee of the proposed observatory.

A thonsand years hence, the JAMES LICK OBSERVATORY, endowed with perpetual youtb, will continue to unfold the mysteries of the cosmos, and to search for new worlds to conquer.

Mineral King District, the seat of a late mining excitement, is in Tulare County, Cal. The boundaries of the district are as follows: Commencing at a point in Tulare County, State of California, where Hockett's trail crosses Little or West Kern river, running from thence east to the center of the dividing ridge between the waters of Little or West, and Big Kern rivers; from thence along said ridge in a northerly direction to the point or ridge that divides the waters of Sonth Kings river and North Kaweah; from thence westerly along said divide fifteen miles; thence southerly to the point where the said Hockett's trail crosses the South Kaweah; thence easterly aloug said trail to tbe place of beginning. The claims are located nnder the new mining laws of the United States.

Sympathy.—To find one who has passed through life without sorrow, you must find one incapable of love or hatred, of hope or fear—one that hath no memory of the past and no thought of the future—one that hath no sympathy with humanity and no feeling in common with the rest of the species.

The *Evenement* estimates tbe number of industrial establishments in Frsnce at 150,000, employing two millions of hands and steam power equal to 650,000 horses. The business done amounts to twelve thousand millions of francs.

Asiatic Cholera in China.

ALMOST EVERY CASE CURED WITH

PAIN-KILLER!

Dear Sirs: During a residence of some ten years in Siam and China, as a missionary, I found your Pain-Killer a most valuable remedy for that fearful scourge, the Cholera.

In administering the medicine, I found it most effectual to give a teaspoonful of Pain-Killer in a gill of hot water sweetened with sugar; then, after about fifteen minutes, begin to give about a tablespoonful of the same mixture every few minutes until relief was obtained. Apply hot applications to the extremities. Bathe the stomach with the Pain-Killer, clear, and rub the limbs briskly. Of those who had the Cholera, and took the medicine faithfully, in the way stated above, eight out of ten recovered.

Rev. R. TELFORD, Missionery in China.

Dear Sirs: During a long residence in China I have used your valuable Pain-Killer, both in my own family and among the Chinese, and have found it a most excellent medicine. In the summers of 1862 and 1863, while residing in Shanghai, I found it an almost certain cure for cholera, if used in time. Indeed, using it in a great many instences, I do not remember failing in a single case. For three years I have been residing in this place, more than fifty miles from a physician, and have been obliged often to fall upon my own resources in cases of sickness. The Chinese come to us in great numbers for medicine and advice. Though without medical knowledge ourselves, the few simple remedies we can command are so much in advance even of their physicians, that we have almost deily applications. We ellow them to come, because it brings us in contact with them and opens a door of usefulness. In diarrhea, colic, vomiting, cholera, coughs, etc., your Pain-Killer has been my chief medicine. Yours, very truly,

Rev. T. P. CRAWFORD, Tungchow, China.

Those using Pain-Killer should strictly observe the following directions:

At the commencement of the disease, take a teaspoonful of Pain-Killer, in sugar and water, and then baths freely across the stomach and bowels with the Pain-Killer clear. Should the diarrhea and cramp continue, repeat the dose every fifteen minutes. In this way the dreadful scourge may be checked and the patient relieved in the course of a few hours.

N. B.—Be sure and get the genuine article; and it is recommended by those who have used the Pain-Killer for the cholera, that in extreme cases the patient take two (or more) teaspoonfuls instead of one.

The PAIN-KILLER is sold by all the Druggists and Dealers in Family Medicines.

☞ Price, 25 and 50 cents and $1.

PERRY DAVIS & SON,
Manufacturers and Proprietors, 136 High street,
oct1 Providence, R. I.

Leather Market Report.

[Reported for the Press by Dolliver & Bro.]

Wednesday M., Oct. 22, 1873.

French stocks of all kinds are in urgent request, especially medium weights. There is also more inquiry for Eastern kinds. Sheep linings are active. The trade generally much more prosperous than of late. We quote as follows:

City Tanned Leather, ₱ lb	28@29
Santa Cruz Leather, ₱ lb	28@29
Country Leather, ₱ lb	25@28
Stockton Leather, ₱ lb	26@29
Jodot, 8 Kil. per doz	$50 00@ 84 00
Jodot, 11 to 19 Kil., per doz	66 00@ 85 00

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Bunker Hill Quartz Mining Company.---

Location of works, Amador, Amador county, Cal. Location of principal place of business, 19 First street, San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 11) levied on the 10th day of September, 1873, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Wales L. Palmer	113	20	$200 00
Wales L Palmer	120	20	200 00
Wales L Palmer	121	20	200 00
Wales L Palmer	122	20	200 00
Wales L Palmer	124	20	200 00
Wales L Palmer	125	20	200 00

And in accordance with law, and an order of the Board of Directors, made on the 10th day of September, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 19 First street, San Francisco, Cal., on Monday, the third day of November, 1873, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WALES L. PALMER, Secretary.

Office, No. 19 First street, San Francisco, Cal. oc18

Buena Vista Petroleum Company.--Location of principal place of business, San Francisco, State of California. Location of works: Buena Vista, Kern county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of September, 1873, an assessment (No. 17) of one dollar per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 320 Jackson street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 25th day of November, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

L. AGUAYO, Secretary.

Office, No. 430 Jackson street, up staire, San Francisco, California. se27

Commercial Coal Mining Company of San Francisco. Principal place of business, City and County of San Francisco, State of California. Location of works, Santa Cruz County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of October, 1873, an assessment of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at his office, No. 402 Montgomery street, room No. 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of November, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the fifteenth day of December, 1873, to pay the delinquent assessment together with costs of advertising and expenses of sale.

S B. HANSON, Secretary.

Office—No. 402 Montgomery street, room No. 23, San Francisco, California. oc18

Cincinnati Gold and Silver Mining Company. Location of principal place of business, San Francisco, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 8th day of September, 1873, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Directors, made on the 18th day of September, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office, of the company, No. 331 Kearny street, Room No. 14, San Francisco, Cal., on the 10th day of November, 1873, at the hour of 1 P. M., of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

WM. SMALL, Secretary.

Office, 331 Kearny street, Room No. 14, San Francisco, California.

Equitable Tunnel and Mining Company—

Principal place of business, No. 35 New Merchants' Exchange, San Francisco, Cal. Location of works, Alta City, Little Cottonwood District, Utah Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh day of October, 1873, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold and silver coin, to the Secretary, No. 35 New Merchants' Exchange, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the tenth day of November, 1873, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Monday, the first day of December, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CHAS. S HEALY, Secretary.

Office—No. 35 New Merchants' Exchange, San Francisco, California. oc11

Hayden Hill Mining Company—Location of works, Hayden Hill, Lassen County, California. Principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of September, 1873, an assessment (No. 1) of Fifteen Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 321 Montgomery street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 14th day of November, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 13th day of December, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. H. KNIGHT, Secretary.

Office, No. 331 Montgomery street, San Francisco, Cal.

Caution.—Ida and Rhoda Lewis Consolidated Mining Company.

The following certificates of stock were sold this day to pay delinquent assessment, No. 1, levied August 28th, 1873:

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.

Parshall's Lubricator for Steam Engines.

These Lubricators are suited to all steam Engines, delivering the lubricant, whether tallow or oil, to every kind equally well. They are subject to be placed in the steam pipe, steam chest cover or the cylinder head, as is desirable. They admit the steam freely to the lubricant, which is constantly saturated with it and kept thereby in a free liquid state. When condensation of the steam begins, the water settles below and raises the oil to the top. The oil is fed from the top of the cup, through a tube which passes down through its center. All sediment in the oil settles to the bottom of the cup, and the oil, on going to feed the engine, is always pure. By simply turning a screw in the top of the cup, the flow of oil is regulated to suit the requirements.

We have numerous testimonials from Railroad Engineers and others, speaking in the highest terms of their superiority. The first one put in use on this coast is at the Pacific Saw Manufactory in this city. Parties desiring further information will please send for descriptive circular and price list, or call at our office.

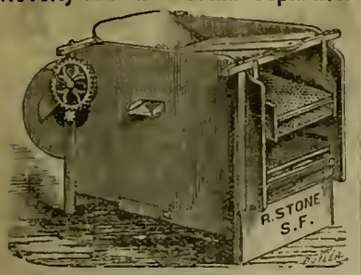
THE PATENT
Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

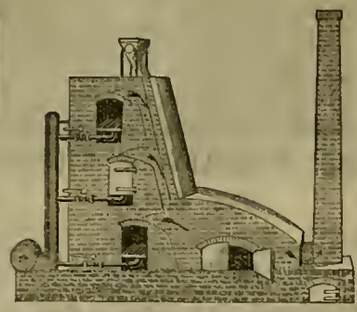
Metallurgy and Ores.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street,

Quicksilver Metallurgy.

EDITORS PRESS:—When at your request I entered upon the subject of quicksilver extraction in your paper, I did so, not with any desire of being personal, or uttering invectives against any one, but that the matter might have free ventilation, for as your correspondent "Novel Plan" truly remarks, "Progress can only be made by an interchange of ideas;" nor will I now enter into an argument with one who abuses the privileges accorded him in the columns of a public journal, by the outpouring of such scurrilous ribaldry and vituperative personalities, as Mr. Riotte has thought fit to give vent to; they only go to prove that he who can descend to such is wanting in all the attributes and finer sensibilities that constitute a gentleman and place him on a scale far below that class, which he so glibly describes as "native born scientific cusses." What his object is I know not, (for he has never been near me,) unless it is anger; because the works of the Oakville mine, belonging to the Napa Company, which he describes as "bankrupt," were put up under his directions.(the furnaces having been patented by Messrs. Riotte & Lockhardt) and Mr. Riotte's especial work connected with the Suction Fan obtained for it the soubriquet of the "Go Devil"and was spoken of in no very elegant terms by one of the parties he names and which turned out such an unfortunate failure. But when he impugns the statement of 20 lbs. to 80 lbs. per ton, and denounces it as an *untruth*, he attacks not me, but the *verity of those very gentlemen whom he holds up in another part as competent authority*, viz: Messrs. Lockhart and Jas. McQuaid, who, as Superintendents of the Napa Co., from the commencement to its close, have repeatedly given oral and written testimony to the Company that it was rarely below 20 pounds, and was generally far above, asceuding upwards to over 80 pounds, and if the ore put through, was, as they assured me, anything similar to that which I saw them discharging into the furnace, their statement was borne out by facts and is worthy of more credence than Mr. Riotte's.

Mr. R. asks with wrathful indignation, if such competent authorities as Knox, Luckhardt, Osborn and Lockhart are to be disputed. In my letter I neither disputed any authority, nor did I put forth any new theory, but that held by men whose names for practical knowledge and scientific attainments do stand higher in public estimatiou than those quoted by him, and this without the least disrespect to them, one of whom at least did not prove the possibility of saving 90 per cent. nor 50 per cent. at the Napa Works, and I think the names of Dr. Ure, Crookes, Rohrig, Makin, Overman, Hunt and a horde of others equally well known are at least entitled to respect, even by such an egotistical proficient as Mr. Riotte claims to be.

No doubt he thought he made a great hit when he termed me a "hoy," etc., I am content he should think so if he pleases, but in that case, what does he consider himself to be, when on his arrival in this country a few years ago, he appeared fresh and verdant from college, in the *far, far East*, in his schoolboy uniform, I had served an apprenticeship of much more than half his term of life, at hard practical work. I shall gladly avail myself of "Novel Plan's" offer to visit and examine his works and mode of operations, before speaking of them, for I think with him that we are never too old or too wise to learn, although I must beg leave to doubt (until the contrary is proved) that he can save 99 per cent.

I regret that my statement respecting the permeation of the bricks in the condenser and ore-chamber at the New Almaden works should have raised Mr. Fiedler's wrath; but I can assure him that there were other gentlemen with me who witnessed the fact as stated, and were further corroborated by the men at the work. And now his own statement, that they were pulled down for the very reason of their proving so unsatisfactory, goes far to prove the assertion. I do not see that such is any personal reflection on Mr. F. or any one there, Mr. Randal conteously informed me why they were pulled down, after my letter had been priuted. I had, therefore, no opportunity of conversing beforehand with those gentlemen, or I should have given their reasons more clearly. The best authorities *do* condemn brick condensers, and urge the adoption of iron in their stead. Wholesale condemnation does not disprove the fact that after twenty-five years working the use of retorts has been found in all respects very practical and satisfactory. HUBERT BANKART.

AGRICULTURAL STATISTICS.—The convention of Executive Committees of State Granges of the Patrons of Husbandry, representing States in the Missouri Valley, which has been in session in Keokuk, Ia., adopted the following preamble and resolution:

WHEREAS, We regard complete and accurate agricultural statistics as the foundation of our control of the business of agriculture, by which we may obtain a suitable and just reward for our labors, and allow the law of supply and demand to operate freely in the regulation of prices, to the benefit of both producer and consumer; therefore,

Resolved, That we will use our best efforts to establish, or cause to be established, in each and every state in our Union, a system of agricultural statistics, by which we can get exact information of the acreage of the principal crops, the amount of livestock in the country, the quality of produce and the number of animals of each kind for market.

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freibnrg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING Co.,)
Little Cottonwood, Utah.)
Superintendent's Office, Sept. 23, 1872.)

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 1, 1873.

VOLUME XXVII Number 18.

Peer & Lundquist's Concentrator and Flume Riffle.

Messrs. Peer & Lundquist have recently patented some improvements for concentrating gold and sulphurets from quartz and gravel, and a new flume riffle with undercurrent, engravings of which are shown on this page. The concentrator, Figure 3, is a simple mechanical contrivance, requiring very little motive power to run it. The labor in attending to it is simply in removing the concentrated matter which accumulates in the pan.

Referring to the cut (Fig. 3) *A*, represents the pan with water pipe; *G*, the screen hopper where the pulp is introduced; *H* an adjustable discharge gate; *F*, *F*, adjustable rods for supporting the pan; *E*, the frame; *D*, the adjustable stand and roller for regulating the grade to the pan; *C*, the percussion. In Fig. 1, *A*, *B*, is a section of lifting and grooved cam; *A*, representing the lifting cam, and *B*, the grooved cam, combined. The pan, *A*, is much the same in shape as the ordinary gold pan used by miners for panning out washings from a flume, only it is much larger in size. The dimensions equal 6 feet by 7 feet, measuring 20 feet in circumference, making a capacity of 5 stamps. The panning movement is done much the same as by hand, being operated by a peculiar lifting cam and grooved cam (Fig. 1) combined. The grooved cam gives the side motion, while the lifting cam imparts an easy motion forward, raising the back part of the cam somewhat, so that the light sands may pass gently out of the pan, leaving the heavier substances upon the bottom, which follow the direction of the percussion on its backward movement. By this means all the heavier particles gradually move to the back part of the pan, where they are made perfectly clean by the aid of a little clear water, supplied by a pipe for that purpose. If there is any difference in the specific gravity of the particles to be concentrated, this machine will collect them, the concentrator being adjustable for all kinds of pulp or sands containing sulphurets, and the action of this machine is such that the fine and coarse sulphurets follow each other.

The flume riffle patented by these gentlemen is shown in Fig. 2. *A* represents a section of corrugated riffle; *B*, the undercurrent with discharge; *C*, the roller; *D*, the flume and *E*, the pulley. The object of the flume riffle and undercurrent is for the purpose of saving the fine gold, quicksilver and black sand which follow each other. Something of this kind has long been sought for, as necessity demands a means whereby the fine gold can be saved, which is almost a total loss in the present mode of washing. The flume riffle with undercurrent is so constructed that it will be durable, and the inventors state that it will cost less than the ordinary flume riffle or blocks that are used. The riffle is made in sections, and each section will not weigh more than 60 pounds; they are made out of a composition extremely hard and tough. The riffle is corrugated, having deep parallel recesses running parallel with the flume, each recess having many apertures to discharge the concentrated particles passing into the undercurrent, where it is discharged through a roller for the purpose of brightening the gold so that it may be readily amalgamated. From the roller discharge it is passed immediately into the gold pan, where the process is completed.

Messrs. Peer & Lundquist have also patented through the Scientific Press Patent Agency a process for separating gold and silver from base metals, by which, after they have been amalgamated from the battery or from the smelting furnace, any base bullion from 200 fine and upwards can be "parted" so that the gold and silver are perfectly pure and malleable. This process is important to mining companies, bankers, jewelers, assayers, etc., from the fact that they are able to refine or separate their base bullion at their mine or place of business without the necessity of sending it away for that purpose. The inventors claim that the expense is very small in treating or separating the base metals, as compared with the cupellation process. The new method is quite simple, so much so that an ordinary person can refine the metals in a short time. The inventors say that a little practice is all that will be needed to accomplish the act of separation. The gold separation is done in a crucible and gold and silver in large amounts are separated in the ordinary refining furnace. Parties desirous of further information concerning these inventions can address Victor Ressayre, agent of the patentees, No. 229 Fremont street in this city.

PEER & LUNDQUIST'S CONCENTRATOR AND FLUME RIFFLE.

The Lick Observatory.

Considerable interest has been manifested, since Mr. Lick's determination to build a large Observatory has been made public, to know where it is to be placed. Mount Diablo, Tamalpais, Mount St. Helena, and other prominent places have been suggested, most of them on general principles, because they are comparatively high peaks and near the city. Colonel Von Schmidt, who was sent by Mr. Lick to select a site for the Observatory, thinks a point on the shore of Lake Tahoe is an excellent one, and the Nevada papers want it on Mount Davidson.

It seems to us that the best thing to be done in the location of this observatory, which is to last so many years, is for Mr. Lick to select a committee of, say, three scientific men, who understand the requirements for such an institution, and let them make a trip to the Sierras and find the best locality. Colonel Von Schmidt is, no doubt, a very good engineer, but he does not pretend to know much about astronomical observations. He has selected a site on the shore of Lake Tahoe, with mountains all about and above and a lake close by. He possibly did not think about local attraction, or evaporation of water. Nor did he recollect that an observatory of this kind should be located either on a peak or a ridge, and not on a mountain side or sloping peninsula. Neither did he take geological formation into account. The Virginia City suggestion is worth nothing, as that part of the country is obscured with fine dust, which would soon wear out the instrument, leaving aside the consideration of clear atmosphere; moreover, Mr. Lick certainly wants the observatory in California.

This location should not be selected without mature deliberation and the advice of those persons who have had experience in astronomical research. It is hardly possible that Mr. Lick, who shows so much judgment and careful forethought in matters of business, should give a large amount of money for an object like this, and then have his plans frustrated by haste in selecting a site for what will be his everlasting monument.

The Largest Gold Bar in America.

In our issue of October 11th we mentioned the fact that a few weeks before the Spring Valley Canal and Mining Company, of Cherokee Flat, Butte county, California, had sent down a gold bar worth $41,000, and weighing 141 pounds. At that time they thought that it was the largest bar ever made, but at their request we made inquiries and found that Seligman & Co., bankers, of this city, had received one from their agents in Helena, Montana, worth an even $50,000. The London and San Francisco Bank had had one worth $35,000, and the Mint and Bank of California had each had one worth $40,000, and the San Francisco Assaying and Refining Works had received one worth $41,000. As the Spring Valley Company wanted to make a large bar and were working their claim energetically and successfully they cleaned up partially and sent down the largest gold bar ever delivered at the United States Mint. The crowded state of our columns last week prevented our mentioning this interesting subject, and we were compelled to defer it until this issue.

The bar was a very handsome one and weighed, before melting, 3,580 ounces, being valued at the Mint at $71,273.15. The Secretary wrote us that it weighed 299 pounds, and its estimated value was $71,445. We measured the bar and its dimensions were as follows: Fourteen inches long on top, 13½ inches on bottom, 5 inches deep, 5½ inches wide on top, and 5¼ inches wide on bottom. The bar took two hours to melt, and only one ounce and eleven-hundredths were lost in the work. The gold was exclusively from the mine of the Spring Valley Company, and was the result of about 35 days' actual run, with about one thousand inches of water. Only a partial clean up was made, and the gold obtained was the return of 800 feet of head flume and 14 under currents. The company has two and a half miles of flumes, and 28 undercurrents. One hundred feet of the clean up was in the tunnel. The flumes had been run so full that it was almost as rich where they left off cleaning up as at the head of the flume, and if they had gone on down there is no knowing how much they would have got.

Can any one who sees the result of this partial clean up say the California gravel mines are giving out? When bars of this kind can be made in such a short run, and when only part of the flumes and undercurrents are cleaned up, it ought to encourage others to try their hand at deep gravel mining. If it were not for exceptional cases of this kind we would seldom hear of what is really being done in our gravel mines, as most of the companies are singularly reticent on the subject of profits. The bar we saw would have made an "old 49er's" eyes sparkle, but its weight prevented any careless handling or danger of loss. It took two men to put it in the crucible at the Mint, and it has been cast into seven bars for convenience in handling. Bars worth upwards of $71,000 are scarce, and it is seldom one sees a fortune in so compact a form.

Bad for Mill Operatives.

Eastern advices predict a hard winter for mechanics and mill operatives, by reason of the many suspensions caused by financial trouble. Dispatches this week began to cite details, and we see that the extensive print works of Garner & Co., Little Falls, Cohoes, Rochester, Pleasant Valley, Newburg and Haverstraw, stopped on Saturday, and threw 10,000 people out of employment. The firm pays $500,000 per month to employés. A Washington dispatch says that 400 mechanics and 1,000 laborers have been discharged from the Navy Yard, owing to money running short in consequence of the extensive improvements made in the Yard this summer. Dispatches from Manayunk, Pa., state that of 12 or 13 cotton mills there, employing from 5,000 to 6,000 hands, only three are in operation, the remainder having suspended for the present, and negotiating for resumption at reduced rates of compensation to the workmen. If many more large institutions like this suspend operations, great distress will be felt by the employés. We may congratulate ourselves that there are no prospects of similar suspensions on this side of the mountains, but we may be benefitted by an influx of skilled labor to this coast. A great many workmen who are out of employment there will doubtless come to California.

New York advices state that the piano, billiard table and cigar manufacturers, and other producers of luxuries are conducting business with great caution. Large factories are being run on half time and with half their usual force, while smaller establishments have shut down altogether. One of the most unfortunate results of the financial panic is the discharge of hundreds of workmen from various large manufactories in the principal cities. The recent heavy discharges from foundries in and around Philadelphia, and the previous similar occurrences in the neighborhood of New York, have a melancholy premonition of more extended trouble. It has now extended to the New England cotton and woolen mills, one suspension in Rhode Island being already announced, and the Manufacturers' Board of Trade of Fall River, Mass., having agreed to recommend a suspension of all mills two days in each week, and to run only eight hours per day the other four days for the present. Several Western manufactories have also taken steps to curtail expenses, and in Baltimore likewise action has been taken at one or more large establishments looking to their economical working while the panic continues.

Foreign Corporations.—Their Right to Mortgage Mines in California.

A vsry important case was decided last week by Judgs McKinstry of the Twelfth District Court, on the powers of foreign corporations to mortgage property in this Stats. The csse is that of Babcock *vs.* the New York and Grass Valley Mining Company, and involved the sum of $20,000. The facts are as follows: The New York and Grass Valley Mining Company kept their account with John Parrott & Co., bankers. The company was incorporated in New York, and represented here by an agent or Secretary, who was also Secretary for many other companies. The bank account with Parrott & Co. was overdrawn, and when the amount due reached the sum of a little less thsn $20,000, the bank insisted on security for the payment of the amount due. The company gave a mortgage on its property, which was not paid at maturity, and action was commenced to foreclose the same and for judgment for the amount due. The case was first tried abont a year and a half ago. The defense set up that the laws of New York, under which the company incorporated, were not complied with in giving the mortgage. Judge McKinstry at this time decided in favor of the defendant. Mr. Bergin, plaintiff's counsel, moved for a new trial, which was grauted and the case was tried agsin and has not been decided. Jndge McKinstry's views on the subject are interesting and importsnt to mining shareholders, and we give the following.

The New York statute of 1848, which provided for the organization of mining compsnies, authorizing such companies to pnrchase, hold snd convey real estste, but prohibited any mortgsge of such real estate. By the amendment of 1864 it is provided that such corporation may mortgage any part of its real estate, and that "every mortgage so made shall be as valid to all intents and purposes as if executed by an individual owning such real estate; provided, that written consent of the stockholders owning at least two-thirds of the cspital stock shall first be filed in the office of the County Clerk of the county where the mortgaged property is situated.

The mortgage, to foreclose which this suit was brought, was offered in evidence, signed by the President of the Company, with the corporate seal attached. If the provision of the New York statute could have been complied with in California, the corporate seal would impart the due performance of the acts reqnired to prosecute the execntion of the mortgage; but the written oonsent of the stockholders could not have been filed in the office of the County Clerk in this State, because our law does not authorize any County Clerk to file such paper.

The Conrt then holds that the powers of the corporation must be ascertained from the New York statute as amended. The defendant hss the power to purchase, hold and convey lands, which includes the power to mortgage. The Act of 1864 provides that the will of the corporation should be expressed in a peculiar manner, and but for this it conld be expressed by the Trustees, snd proved by the corporate seal. To give an extra territorial effect to the provision of the New York ststute, it would be necessary to hold that New York could legislate for California. But the New York Legislatnre simply provided that the corporations by it created should exercise certain powers in New York, and that the power to mortgage should be employed only in a particular manner. The manner cannot be allowed in California, but the power exists here because it exists in New York.

The Courts of California recognize the right of foreign corporations to do here what they msy do at home, but the power having bsen conferred by the foreign State, no principle of comity requires of us to regard a limitation upon the mode of its exercise, which amounts to a prohibition here. The comity which induces us to recognize a foreign corporation, is limited by our own positive law and the public policy which provides our laws. It is, however, the policy of our law to facilitate the transfer of real property by natnral or artificial persons, and to permit its conveyance and the creation of contract liens npon it. It would be in violation of this policy to recognize the right of the foreign Legislature to prohibit the mortgaging of lands in this State, while it permitted mortgages at home, thns not only interfering with the uniform operation of our laws, but enacting a provision of law which can only take effect beyond the territory within which the foreign government has power to legislste. We must admit, therefore, that the same corporation can mortgage its lands in New York and cannot in California; or that public policy requires of us to ignore the limitation upon the mode when it is sought to apply it here, and hold that the corporation can exercise all the powers here which it can in tbe State where it was created, in the manner practicable under our system, and accordant to the general rules of law. I will sign findings and a decree foreclosing the mortgage.

Cleaning Weapons with Petroleum.—In addition to the great solvent power of petroleum, it does not beoome rancid or gummy as other oils are liable to do. A writer in *Les Mondes* aaya that common mercurial ointment is also remarkably efficacious in preventing the formation of ruat upon articles of iron and steel, such as gun barrela and the like.

Chemicals in Pan Amalgamation.

[Continued from page 266]

Slimes constituts the clayey portion of the ors which flows from the battery in wet-crnshing mills, and is imperfectly csnght or sttled in the tanks constructed for the purpose of catching the crushed ore. It is nsedless to say that with a sufficient numbsr of tanks these slimes could be saved, but lack of space generally renders this impracticable, and the nsnal plan is to allow them to flow into reservoirs outside of the mill, from which they are sfterwards dng ont, allowed to dry, and hauled to the mill.

The mechanical trestment of slimes varies bnt little from that of ordinsry ore. Their finely divided condition renders grinding nnnecessary, and calls merely for a sufficiently violent motion to thoronghly incorporate the quicksilver with the pnlp.

The length of time devoted to the amalgamation of a charge of ore is influenced to a great extent by the amalgamating capacity of the mill, and by various reasons of economy. It often becomes advisable to sacrifice a certain percentsge of the value for the sske of working a greater number of tons per diem. To insure good results a charge should not remain in the pan, subject to the action of quicksilver and chemicals, less than six to seven hours.

In working ordinary ores the quicksilver is not added until the pulp is thoroughly ground. This is to prevent the flouering of the quicksilver; but since slimes require no grinding, one might suppose that it would be more advantsgeous to put the quicksilver into the pan on charging, thus allowing more time to the amalgamation.

Experience has, however, shown that better results are obtained by putting in the chemicals, *i. e.*, sulphste of copper and salt, first, snd adding the quicksilver from two to three hours later, thus allowing the intervening length of time for the decomposition or "preparation" of the refractory minerals. The reason of this is not immediately apparent, as the quicksilver charged simultaneously with the chemicals shonld attack the chloridized (?) silver-minerals *in statu nascenti*. The amount per ton of chemicals employed vsries with the richness of the slimes. The quantity is always largely in excess of thst called for by the chemical equivslents of the minerals to be acted upon, but in very large pans the relative proportions may be diminished. Taking ordinary slimes, assaying thirty dollars per ton, as a basis, the average quantities of sulphate of copper and salt employed per ton are 10 to 12 pounds of the former and 20 to 25 pounds of the latter.

These quantaties may be advantageously increased on slimes of higher grade. The exsct amounts mu be determined by conscientious assays. In working slimes of uniform character, the varying fineness of bullion fnrnishes an excellent empirical test of the amount of chemicals to be employed. The baseness of the bullion incresses with the qnantity of sulphate of copper used, owing to the precipitation of copper by the iron of the pan, and its consequent amslgamation. The millman discovers that beyond a certain point an excess of sulphste of copper produces no adequate results heside reducing the fineness of his bullion. Having once determined the average fineness of his bullion when working under the most favorable circumstances, he increases or diminishes the amount of sulphate of copper as the bullion becomes finer or baser than his standard.

The same amonnt of chemicals with richer slimes will produce finer amalgam, which is due to the fact that a larger amount of silver is amslgamated while the same percentage of copper is precipitated. Shonld the value of the slimes and consequent fineness of the bullion increase materially, it becomes necessary to determine by assay the most advsntageous proportion, and to adopt a new standard of fineness. A source of great expense in the working of slimes is the excessive and apparently unavoidable loss of qnicksilver. Working with all the advantages of settlers and agitators, this loss seldom falls below four pounds per ton, whereas in quartz mills it does not as a rule exceed 1¼ to 1½ pounds per ton of ore. Thia is undoubtedly due to the natnre of the slimes, which have the same effect upon the quicksilver as oil or grease, forming a film or coating over the surface of the metal, and preventing the glohnles from uniting. The minute particles settle with difficulty, and to a great extent flow off with the tailings. The excessive loss in working slimes cannot with jnstice be ascribed to the action of chloride of copper, as in working the tailings by the same process the loss of quicksilver per ton is not greater than in ordinary quartz mills, thns proving sufficiently that the deleterious action of chloride of copper npon qnicksilver is not appreciable upon so large a scale.

Many attempts have heen made to effect a saving of quicksilver in milling but so far only mechanical applisnces have met with success. Although sodium, sodium amalgam, cyanide of potassium, etc., are very effective in temporarily "enlivening" the quicksilver, their action speedily dies out after the latter haa been tranaferred to the pan, and experience has sufficiently demonstrated that when employed in practicable quantities they have no effect in aiding the amalgamation. The only thorongh method of cleansing quicksilver is to retort it, and the use of proper straining-sacks will render a recourse to the method unneocasary.

[To be Continued.]

Hydraulic Mines in South America.

Our readers will remember, ssys the Panama *Star and Herald*, the romantic acconnt we published some tims ago of the anriferous regions of and around Barbacoas, in Columbia, fnrnished ns by the pen of Dr. Weavsr, who had at great expense and risk prospected these little-known regions of the United Statss of Columbia, and saw enough to convince him that for surface gold washings the hills, streams and valleys about the Yacula mining region were at least equal to the best dsys of California.

Dr. Wesver betook himself to California, and described to his old mining companions in San Francisco the evidence he had of the abnndance of alluvial gold away back from Barhscoas among the hills and spurs that give origin to streams that join the waters of the great Amazon river. Dr. Weaver psssed through here not long ago on his return from California bringing with him the necessary hydraulic machinery and agents on the part of a compsny in San Francisco who were to test for themselves, and on behslf of the company, the wonderful riches of the soil of the Yaculs mines.

We have now information that Messrs. McBrown & Co., who had agreed on the part of a California company to pay $100,000 for one-half of the territory, if on inspection the soil wss found to be as rich ss Dr. Weaver represented it to be, have already agreed to purchase the property, and are at work putting np hydraulic machinery and digging a ditch to be washed out by these improved methods in use in California. The latest accounts from the mines are that the work hsd been commenced in earnest, with a perpendicular fall of water of 200 feet. The final washing np hsd not yet tsken place, but large nuggets of gold had bsen seen rolling down with the dirt before the stream of water impelled over it.

There is no doubt that the result of these mining speculations and success is bonnd to exercise a great and beneficial influence in the south of the State of Cauca, and besides attracting a large and industrions sddition to the population, will stimulate to extended efforts to realize and bring into the market an amount of gold, which, but for the persevering efforts of Dr. Weaver and his companions, would still remain nseless in the alluvial deposits of the valleys and streams of the Yacnla hills. We have no doubt the Government of the State of Cauca will give all the protection and aid required to organize and protect those who have opened up to Columbia the knowledge of so much hidden treasure, hy securing to individuals or companies the fruits of the labor, experience and industry. It would be well for the Government of the Isthmus to offer facilities to foreign miners to protect the mining regions of this State also.

Fissures or Deposits.

It is a matter of surprise to many persons that there should be snch difference of opinion between miners as to the relative value of mines situated in limestone or other formations. The miners of the Pacific Coast are alwsys looking for fissure veins in granite, slate or qusrtzite, while the English miner, with the advantage of many ysars' experience, prefers the deposits in limestone and does not consider the greatest valne to be fonnd in fissure veins. Limestone is the natural place to look for deposits, consequently the mines generally purchased by Englishmen have a very brilliant existence and pay immensely for a short period. The fissures are more slow in development, but are regular and lasting. With time and proper development they become richer as depth is attained. They are not usually surface mines, nor at the best near the snrface. It is true that fissnre veins pay the most regular profit, but the deposits are nsually fonnd so near the surfsce that the ore is very readily extracted and at very low rstes per ton. No mines in the world are paying so large dividends or csn do so, for a length of time, as those in fissnre veins, as is evidenced in the Crown Point and Belcher mines, on the Comstock, and the Raymond & Ely and Meadow Valley, in Pioche. To the man who invests in mines and mining stocks the most sure are the fissure veins for continusnce to a great depth. While in deposits the profits may be very great for a time when a body of ore is found; still, when worked out, there is a necessity for still farther explorations nntil another deposit shall be discovered, which requires time and money; and after the expenditure of both, success is not alwsys assured. Successions of ore are generally discovered with bodies of limestone hetween, and the ore deposits are of great value. The "dead work" and the time consnmed is not satisfactory to American miners, who prefer the fissure veins, although they may not be so rich as a deposit in the paying portion. The Eberhardt, Aurora, and Richmond in this State, and the Emma, in Utah, are of the class most satisfactory to English miners. Whatever view may he taken of the mines of Nevada there are large bodies of valuable ore both in fissnrea and deposits, and the day is fast approaching when mines will be worked by their owners as a regular businesa that will be remnnerative. With both clasaea of minea, and free ores and baae, all classes of miners can be suited, and mining men will become a class who will develop the conntry with less hazard than in the psat. The immense richea of the State are being developed alowly, but with certainty of good resnlta. The riska in mining investments are becoming less, year by year, and the value of stocks is bsing sattled by the worth of ths propsrty upon which they are issued. The yield of bullion is immenss, and it is produced at a profit. The new districts are being opsned, and fissnres and deposits ars both found in immense nnmbsrs, Capital well directed in the production of silver bullion and in the making of base bullion has a reward that is snfficient to mske up for the risk in sxtracting the ore and in making it of commercial value. With the improvements that are being msde in lessening the expense in sll departments of mining, milling and smelting, there is a greater opportnnity for profit to he made now than at any time heretofore. Improvements will still be made—capital will be put into mining, milling and smelting operations more freely as they become less hazardons and we look upon the present as bnt the dawn of brighter and better times for the State in her material interest.—*Virginia Chronicle.*

The Mining Interest.

If the indications which are usnally supposed to hold good aro to be relied on, the coming winter glves every promise of being a most favorable one for the prosecution of the grest industry of this county. It is a thing to be regretted that the unfavorable seasons for sevesl years psst have had a tendency to diminish the mining element of onr population, as on the number engaged in that pnrsnit, and their success are, in greater or lesser degree dependent the property of all interests and business which make np the labor-field of our popnlstion.

Of lste years only it may be said that the art of mining has reached that degree of perfection which is necessary to make the prosecution of this industry remunerative. Most of the gold deposits in the beds and bars of the streams have been worked out, or sfford employment to only a limited number. Hill and hench mining become paying indnstries when they are followed by all the appliances which late discoveries have brought into use, and the true kinds of gold-saving apparatns substitnted for that which has had its day and mnst now be lsid aside. Many of the old theories on which mining has been conducted in former years, are disproved by the test to which modern inventions hss supplied. It is now generally conceded a large volume of water used in a flume will save gold better thsn a small stresm, which is one point of difference from the opinion held a few years ago. In hill and bench mining two things are necesssry; to thoroughly separate the gold from the earth, and to give it a good chance to settle through the lighter materials to the riffles. Much of the gold lost in ground sluicing and hydraulicing is due to the fact thst it never wss sepsrated from the earth in which it was embedded, but carried along adhering to the clayey lumps, to the dump. This is the resson why old tailings from hill and flat claims will sometimes pay almost as well to work as the original gronnd; the lumps, small and large, by being long exposed to atmospherio action, become slackened and essily pulverized, and the gold readily settles to the riffles if the volume of water is strong enough to csrry away the lighter debris and keep the bottom of the flume or sluice olear. Gold, having a specific gravity nineteen times that of wster, and mnch greater than any of the snbstances with which it is associated in the ground, cannot be easily washed away if it is given a chance to effect a lodgment in the riffles.

In those parts of the State convenient to the line of travel which were formerly the centers of a great mining population, the shsllow surface mines were exhausted yesrs ago, and the miners were, perforce, driven to the discovery of new inventions which should make ground available for mining purposes whioh conld not not be worked to any profit with the manner of working them in use. The result of some of these inventions has been to work a complete revolution from old modes and systems by which mining had been carried on, and give at once a character and value to thousands of acrss of land before accounted worthless. It is only within the psst two or three years that these improved methods have been introdnced into the mines of this county, and their advantages are apparent as soon as known. It is safe to say that here, as elsewhere, they will revolutionize the business of mining and give to thst occupation a permanency it has not heretofore known. The results oannot fail to be in the end most benefioial to the county. Alresdy there has been a marked appreoiation in the value of mining property, and it will ultimstely lead to the securing of patents to a great desl of heretofore nnclaimed and nnworkable land, and the appropriation of water which has been suffered to run to waste by the fear that paying placers could not be found extensive enough to justify the outlay of capital necessary to make it available.

In all those claims in which, dnring the past winter, the improved machinery and methods of mining were introduced, the success attendant was most gratifying, particularly when the extreme shortness of the mining aeason lsst year is taken into consideration. The result has been that operations of the aame nature, on a greater scale, will be entered into the coming winter, and if the snccess is commensurate with the expectations, we can look for a new era in the prosecution of thia industry which cannot fail to work most beneficially to the advantage of every olasa dependent, directly or indirectly, npon the success of the mining interests for their own business profits. —*Trinity Journal.*

MECHANICAL PROGRESS.

Cheap Motors.

A history of tho attemj ts to find a more economical power than steam, says tho *Iron Age*, were it possible to write it, would ho one of heart-rending failures, of hopes dashed to the grornd, of wild expectations cooled by unexpected results. Wheu Watt made his great improvement iu the then existing steam cugine, of placing the cylinder in one condition aud the condenser in another, or, in popular words, making a hot portion and a cold portiou to his eagine, the work he had commenced was far from completion. During the years of after l.bor he so perfected and refiued, if the expression can be used, every portion of the apparatus, that the cngiue of the prcsent day is iu principle mnch as it came from his hands, the modern improvements in almost all cases being confined to minor detaile, or made possible by the improved means ot working metals. It is hnt natnral that inventive talent should, at these stages, have eudeavored to devise a better and cbeaper motor than steam, aud to create or develop power by combining chemical or mechanical discoveries in snch a mauner that an apparatue capable of snperseding the steam engine should be the result. Up to the present time, however, no one has yet succeeded in solving this problem. Prominent among numberless attempts, the hot air engine, invented by John Ericsson many years ago, deserves the first notice. This eminent engineer spent time and money in the perfecting of his invention. The principle was simply this: Atmospheric air was heated and then allowed to pass into a cylinder having a moving piston. Heating the air caused it to expand, and consequently to pnsh the piston toward one end of the cylinder. With wonderfnl ekill and ingennity the inventor worked up the mechanical details of his engine, but, despite all this, it mnst be recorded as a failnre in one sense of the word. The small increase in volume of the air dne to the increased temperatnre, made it absolutely necessary to nse large cylinders for comparatively emall powers, and the rest of the mechanism being on much the same scale, the result wss that the engine for every horse-power of work dsveloped was many times heavier than a steam engine of corresponding power. Many other difficnlties presented themselves when engines of large power were made, and the resnlt is that to-day this style of motor is alone nsed in sitnations where room is of no consequence, where skilled labor cannot be had, and where small powers are alone reqnired. On Mr. Ericsson'e idea numberless lesser lights have, as experience gave them knowledge, made improvements, so that now we hsve a number of competing deeigns in hot air engines, each one p ssessing some small advantage over the other tut none reslly capable of steadily giving over five or eix hores-power of work.

Another invention, or rather class of inventions, known as gas' engines, have had some small reputation. Common burning gas mixed with atmospheric air in the proper proportions, makes a most explosive compound; this on being let into a cylinder was ignited by the sparks from an electric machine, or else by a separate flame, an explosion was the result, which, for the moment, generated considerable pressure, forcing the piston in one direction or the other. This, though good in theory, came to grief because of many practical defects. The sudden explosion wae too much of a shock, the great heat generated in the cylinder wae prejudicial to all packing, and required a conetant eupply of cold water to cool the outside; this, combining with other causee, gradnally pushed thie deeign of engine ont of the market. A new gas engine hae lately been coustructed which utilizes gradnally the increaee of volume due to combnstion, the gae being fed from a reeervoir of gae and air at a coneiderable preseure. Thie invention has not ae yet been tested by long nse, but it hae many points of snperiority, though it reqnires that the cylinder ehould aleo be kept cool hy water. Its economy is very great, 40 feet of common gae furniehing one horsepower per hour. Enginee have been constructed neing gunpowder, or other explosive snbstancee, behind a moving pieton, but all such attempte, though presenting alluring features to the sanguine inventors, have invariably resulted in practically nothing. One inventor made attempte to produce power by burning the oxygen out of air contained in a cylinder, the result being a partial vacnum. The many attempte to devise a cheap electric motor have been, each and all, such signal failnres, that it would be dishearteniug to recount them. It is useless to proceed further in the construction of electric motors till we find a eource of electricity, cheap, abundant and compact. Numberless experiments have beeu tried with various substances whose hoiling point is less than water, but they have been alike unsucceseful. The property posseeeed by ammoniacal gas of condensing, when brought in contact with cold water, and again freeing itself on the application of heat, has been extenoively experimented npon, bnt with small snccees. The pagee of the Patent Office Reports tell a sad etory of misapplied effort in thie direction, but it is to be hoped that eome good will ultimately reenlt from these now uselees inventione. What may be accomplished in the future none can tell, but for the preeent it would eeem that efforts to provide more economical motive power give most promise of euccese when directed to the improvement of the steam engine.

The Manufacture of Paper.

According to a recent estimate, which may be cousidered as approximate rather than exact, the total annual prodnction of paper in the civilized world is one million tons; and of this nearly one-third, or 317,337 tons, is manufactnred in the United States. There were in this conntry, by late statistics, 812 paper-mills, making an average of about $67,000,000 worth of paper yearly.

The uumber of uses for building, clothing, ornamental aud other purposes to which paper is now applied after its manufacture ie only paralleled by the variety of eubstances from which it is fonud that paper can be made. A mill has lately been started in Illinois, in which the "rag-weed," which the farmers plow in, in large quantities every year, is to be turned to good account by making it into paper and rope. The use of oat-husks for a similar pnrpose was begun some time ago, and is the subject of one or more patented processes. In one of these the husks are immersed in water and the mustard and other seeds floated off, the water being well stirred to facilitate their separation. Tho hnsks are then allowed to settle, the enrface scum and floating seeds skimmed or drawn off, aud the water drained ont by a waste-pipe at the bottom of the tank, the hnsks being kept back hy a strainer or perforated false bottom. By steeping in the water from five to ten hours, the hnske are softened and the silica loosened from the fiber, thns facilitating the snbseqnent boiling process. The remaining stages of the work are substantially the ssme as in the manufacture of paper from straw.

In making paper from rags, as a practical writer on this subject forcibly argues, the common impreesion that some one particnlar stage of the work is the critical aud trrning point, and that if dne care and skill are exercised at that one step all the rest will come right of themselves, is a dangerous fallacy; the trnth being that continnal and vigilant watchfulness, in *all* parts of the process of mannfacture, is necessary to the production of a good article of paper. The same writer maintains that the rag-room is one of the most important departments of the mill, though often the least cared for; aud that thorough work at this initial stage of the business is indispensable to a satisfactory final result—which is certsinly a reasonable view. In regard to getting rid of the mixtnre of iudia-rubber which is now in euch nniversal nse that it is fonnd in all kiuds of rags, and is extremely troublesome, being insoluble by any of the chemicals ordinarily used in paper mills, he meutions the plan adopted by a British proprietor, who paid the sortere a certain price per pound for all the rubber they found in the rags dressed by them. The rubber thus collected was weighed at the end of each week and burned np, so that it should not be returned and paid for a second time. Whatever may be the method of removing the rubber, it mnst be done in the rag-room, as it will not do to depend on the screen retaining it after it is ground up. Ae regards whalebone, another like source of annoyance, the same writer advises the employment of one or two extra hands expressly to rip up old corsets and similar articlee usually contaiuing whalebone. This is claimed to be a more economical method than to trust to the fidelity of the other sorters for throwing ont the whalebone, or to sell this class of rags cheaply, for the manufacture of lower grades of paper.—*Mechanical News.*

Waste of Power.

The power needed and the power consnmed in wood-shops are two quite different thinge. The old saying that time is money, ie equally and more obviously true if rendered, power is money. It is an element of cost, just like oil, toole, or lnmber. Power ie, however, a less tangible thing, and hecanse it is not seen and handled, ie too often allowed to waste and escape under the notice of those who are rigidly careful iu other matters. How common it ie in going into a shop to hear the belts screeching on the pulleys, belte runniug half on the tight pulley when it is standing, or eometimee a machine blocked to keep it from starting, with the belts dragging on the pulleys. All this meane waete of coal and waete of money, not by loss of power alone, but by the destrnction of belts. If a belt ie allowed to rub on a tight pulley, or any other fixed object, it is at once heated and etretched, and ae it etretches on one eide, the tendency ie to draw it more on to thie object; if on the edges of tight pulleys, which is most common, its driving power is impaired to the extent that it is rubbed or stretched on its edgee, ae no contact takes place when it is shifted. Whenever a heated bearing is eusected, the rule is to hunt it np at once and correct it; the eame thing ehould be done with the screeebing of belts—whenever heard, look it out, and change the shafting until it runs true. A belt always runs to the nearest end of a shaft, which is juet the oppoeite way from what is generally supposed. The old theory that a belt alwaye rnne to the highest part may be true, and is undoubtedly true with reference to the convexity of the face of pulleye, bnt does not apply to pulleye that are eet diagonally to the line of the belt.—*Cabinet-Maker.*

Drier for Oil Colors and Varnishes.—Water, 100 parts; Gnm-lac, 12 parts; Borax, 4 parts.

The sand blaet ie being applied to all kinde of cnttinge. It will not only engrave and perforate glaee, bnt all hard eubetances.

SCIENTIFIC PROGRESS.

The Altitude at Which Men Can Live.

There has been a great deal of discnssiou as to the altitnde at whieh human beiugs can exist, and Mr. Glaisher himself can tell ns as much about it as anybody. In July, 1872, he and Mr. Coxwell ascended in a balloon to the enormous elevation of 37,000 feet. Previous to the start, Mr. Glaisher's pulse stood at 76 beate a miuute, Coxwell's at 74. At 17,000 feet the pulse of the former was at 84, that of the latter 100. At 19,000 feet Glaisher's hands and feet were quite blue, but uot his face. At 21,000 feet he heard hie heart beating, and hie breathing became oppressed; at 29,000 he became eenselese; notwithstanding which the aeronaut, in the interest of science, went up another 8,000 feet, till he could no longer nse hie hands, and had to pull the string of the valve with his teeth. Aeronauts who have to make no exertions, have of course, a great advantage over membere of the Alpine clnb, and those who trust their legs; eveu at 13,000 feet these climbers feel very uncomfortable, more so in the Alps, it seems, than elsewhere.

At the monastery of St. Bernard, 8,117 feet high, the monke become asthmatic, and are compelled frequently to descend into the Valley of the Rhone for—anything bnt "a breath of fresh air;" and at the end of ten years' service are obliged to give up their high living and come down to the usual level. At the ssme time in South America there are towns, snch as Potosi, placed as high ae the top of Mount Blanc, the inhabitants of which feel no inconvenience. The highest inhabited spot in tho world is, however, the Bnddhist cloister of Hanale in Thibet, where twenty-one priests live at an altitune of 16,000 feet. The brothere Schlagintweit, when they explored the glaciers of the Ibi Gamin, encamped at 21,000 feet, the highest altitude at which a Europeau ever passed the night. Eveu at the top of Monnt Blanc, Prof. Tyudali's guides found it very nnpleasant to do this, though the Professor himself did not confess to feeling so bad as they. The highest mountain in the world is Mount Everest (Himalaya), 29,000 feet, and the condor has been eeen "winging the blne air" 500 feet higher. The air by the by, is not "blue," or else, as De Saussnre pointed ont, "the distant mountains, which sre covered with enow, would appear blue also;" its apparent color being due to the reflection of light. What light can do, and does, is marvelous; and not the least is its power of attraction to humanity.

Alcohol in Bread.—It has been generally stated that the alcohol formed in dough during the process of fermentation is all expelled in the process of baking, but eome earnest teetotallers may be pained to learn that Mr. T. Bolas finds that a perceptible quantity of the intoxicating fluid may be obtained from so emall a quantity as two ouncee of bread. From the report of his investigations, published in the *Chemical News*, it appears that six samplee of new bread, bought at shops in London, yielded from .221 to .401 of 1 per cent. of alcohol. After the bread had been exposed to the air in a moderately warm room for a week, two-thirds of the alcohol had evaporated. Mr. Bolss remarks that "the amonnt of alcohol contained in bread ie too small to be of any dietetic importance, but it may be, perhape, worth while to notice, that forty two-pound loavee are about equal in alcoholic strength to a bottle of port. He hopee soon to determine the amount of alcohol which dough loeee while baking. Our readers probably recollect that eome yeare ago attempts were made in England to eave the large amount of alcohol eupposed to be loet in baker'e ovene. A good deal of money was sunk in the experiment, but it wae fonnd that the amonnt and the quality of the epirit obtained were not euch ae to make the process remunerative.

Grenade, a New Dye-Stuff.—A eecondary product of the manufactnre of fuchsine, employed for some time in dyeing woolen goode, nnder the name of cerise, aniline, orseille, etc., hae of late contained impurities in the form of insolnble foreign eubstances, which hae enggeeted the effort to render it snfficiently pure to warrant its use with the finer fabrice. A dye-stuff named grenade has been produced at the factory of Knosp, in Stuttgart, which ie eaid to give a pure garnet-brown, free from the dirty blnieh-red tint of cerise and other subetances substituted for archil, and which, by combination with picric acid, tnmeric, etc., can be made to give any shade of brown. The brilliancy of the color eurpaesee that of gennine archil. It is applicable to woolen, cotton, eilk, leather and wooden articlee, by nse of different mordants, and is practically cheaper than ceriee, by reaeon of low firet coet, and abeence of ineoluble residue. Dr. Reimann predicts for it a permanent place among dye-stuffs.

Nitrous and Nitric Acids in Rain Waters.—Some new observations on the alternate predominance of nitroue and nitric acide in rain watere have been made by M. Chabrier. When the weather is calm and the etorm distant, nitrous acid ie almoet alwaye in greater or lees excees in relation to the nitric; bnt the latter acid is dominant in the rain of etorms, eepecially in that whioh falls abont the middle of the tempeet, or when the wind ie very high. The season is favorable to the prodnction of nitrous acid when it is accompanied by calm and cloudy weather, by an average temperature and a high state of the hygrometer. It is favorable to the prodnction of nitric acid when the temperature is high, the air violently agitated, and the weather dry and etormy.

Finding Breaks in Ocean Cables.

Some readers have doubtless been at a loss to know how the shore operators in event of a fracture of an ocean cable, are enabled to ascertain at what point the break lies, so that a repairing vessel can be sent directly to the damaged or broken portion. With the aid of the Philadelphia *Ledger*, we offer the following explanation: "Every part of the long dietance of wire and every fathom of the vast abyes of water, are within the reach of the electricisu's instrumental haude, aud within the ken of his scientific eye. It ie qnite practical for him to locate the fanlt or the break within a half mile of its actnal poeition, no matter where it is. Althongh these far-reaching powers sre among the great marvels of modern science, the means and the principles throngh which they sre exercised are the simpleet things when seen aud understood. A telegraphic wire will transmit an electro-magnetic wave or cnrrent in proportion to the square of its diameter. The resistance to the trsnsmission of the waves diminishes in proportion as the sqnare of the diameter is increased. This is one law for the electrician. The eecond is that the resistance to the transmission of the wave increases in direct proportion to the length of the wire or cable over which it is sent. These two laws furnish the basis for the electrician's observations, calculations and resnlts. He knows, to start with, the preciee amount of reeistance that a mile of cable will oppose to the transmission of a given quality of electro-motive force. He has delicate and wonderfnl instruments made by expert mechauics, that enable him to measure this with accuracy for a mile or ten thousand miles. Having this knowledge and these measuring instruments, aud having control of the quantity of electricity he is pntting on the wire, he is able to calculate to a nicety how many miles of cable it is transmitted over before it encounters a greater resistance than that which ie due to the length and diameter of the cable itself. At or near the end of that number of miles from land, and two miles nnder the surface of the sea, the 'fault' or break the electrician is in search of will be found."

The mannfacture of glycerine has of late, in view of its constantly extending importance in the arts, been greatly expanded. During the past year the production in the United Statee reached 2,000,000, lbs. of which one firm in Cincinnati manufactnred one half. Iu a communication addressed to the French Society of Civil Engineers, M. Austin has highly recommended the employment of this substance as an anti-incrnetator in steam boilers. Glycerine, which is soluble in all proportions of water, appeare, according to M. Austin, to increase very notably the solubility of the lime salts, to which the evils of incrustation in boilers are mainly ascribable; indeed, according to the author, it really forms with them a soluble compound. When the lime salts accumulate to such an extent ae to be no longer soluble in the glycerine presnt, they are deposited in the form of a gelatinoue sediment, which does not adhere to the boiler surface. M. Austin recommende the employment of one pound of glycerine to every 300 or 400 ponnds of coal hurnt. From actual trials made with the material, it is declared in the communication that the employment of glycerine for thie purpose, and in the manner above described, proved succeesful.

Gas from Water.—Some curious accounts of a process for obtaining gas for illumination from water have been publiehed, bnt the difficultiee in the way of rendering euch a process practically or profitably available seem to preeent themselves in this as in former methods. Among the latter may be mentioned that of M. Florett, who contrived a power of decomposing eteam, by means of coke heated to a high temperature in an atmosphere of oxygen. Mr. Paine, of Maesachusetts, proposed to decompose water by the aid of electro-magnete; another inventor'e plan wae to effect it by the force of a galvanic battery; and still another propositiou was that of aseieting the action by using a ealt of ammonia or a vegetable acid, as oxalic. The fate of these varied attempte to accomplish the object in question, is well known. A later procese wae that of decompoeing eteam by paseing it over incandeecent charcoal in euch a manner ae to form hydrogen and carbonic acid, the latter being abeorbed in the usual way by meane of canetic lime. It is very easy to eee why these various proceeeee failed to relalize in any valuable or practical sense the aeeumptione of their originatore.

Purification of Hydrochloric Acid.—M. Enzel proposes to remove the arsenic which is a conetant impnrity in commercial hydrochloric acid by adding to each litre of the acid, four or five grammes of hypophosphite of potassium. The areenic ie speedily reduced and when entirely depoeited, the clear acid is to be decanted and distilled in the ordinary way. Hypophoephite of potassium may also be used for the detection of arsenio in hydrochloric acid, since, on the application of heat, the arsenic is immediately redneed.

Our Weekly Stock Review.

THURSDAY EVE., Oct. 30, 1873.

The Stock market hae been quite as active during the week nuder review aa last week. Some startling finctnations in pricee have occurred, bnt people are becoming accustomed to great and sudden changee dnring the past few weeks, and manifest no astonishment at a state of things which, a short time ago, would have eeemed bewildering. What the next move will be is ever a matter of mere conjecture, in stocks, and though we are favored with no lack of acute surmisee and prognostications hy intelligent reportere, who are, of couree, in the closest confidence of the heavy operators, we are still at a loss to know "what the morrow may bring forth."

Comstocks have remained the center of attention. American Flat mines have manifeeted considerable activity, at risiug prices, without any very important news to influence the market. Consolidated Virginia, the "pet," has fluctuated slightly, but remains at the end of the week in about the eame poeition as aseumed at the beginning. The Superintendent seut $30,000 in hullion Mouday morning to the refinery here, making $50,000 in all. Three mills are steadily rnnning on Coneolidated Virginia ore.

Overman has eurprised its friends hy an important advance in price, $24.50 having been tonched, or about four times the price noted but lately. This may he only the result of a snddeu partiality on the part of eome dealere, hut at the eame time more favorahle diepatchee have been received of late from the mine, which have had their effect aleo on Segregated Belcher, which ie in cloee proximity.

The Washington and Creole Co. have recently added to their stock hy the purchase of 25,000 sharee, a controlling intereet of the Mazeppa mine, giving 75 cente per ehare. The former company manifeet great activity in their management and are evidently preparing for a vigorous prosecution of the work of development.

The Ely mines, so long neglected on account of the excitement in Comstocks, do not ehow any eymptome of recovery ae yet. The Kentucky suit against the Raymond & Ely ie enpposed to he now heing tried, and ie to he decided withont jury. Comparatively few eharee of auy of the minee of thie district have changed hande, and all the stocke have been weak. A suit againet Raymond & Ely ie now snch an old story that it doee not give riee to much epecnlation on the reenlt.

Among the Idaho etocke, Golden Chariot and South Chariot at one time eeemed to be on the point of making a dash npwarde, hut the movement did not hold. In epite of the weakness in Idaho stocke, reports still come in o good prospecte from most of the mines.

On Monday the following aeeessmente were added to the price of the stocke: Imperial, $1; Savage, $5, and Utah, $1.

If no other reason were assigned for the late general rise in the market than the approach of the season of greater bullion prodnction, thie no doubt ehould have ite weight. Ae yet, however, the Cometooke are still tronhled with want of water, especially Crown Point and Belcher. Large eupplies of rock are accumnlating in consequence, which will greatly add to the hnllion product, when the mills are aesisted by a riee of water. It ie expected that a very large enpply of bullion will be eent here this year, from this State and Nevada, as from all quartere we hear of unueual euccese in finding paying ore bodiee.

It ehould not, therefore, he hastily concluded that there is no eolid foundation for increaeed valuee, and that theee represent only a purely fictitioue eetimate placed upon gamhling etocke. There ie real and euhstantial reaeon for the change.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the minea mentioned.

California.

ALPINE COUNTY.

MONITOR & NORTHWESTERN S. M. Co.—Since our laet, work on the dam has been puehed with vigor, and things begin to look ehip-ehape in that vicinity. At the Silver Glance property the hoisting worke were etarted up on Monday, and worked like a charm. The ehaft wae finished to the 75-foot level, and eome ore taken ont which ehowed exceedingly rich in enlphnrete. In the weet drift the minere opened a pocket of ore aseaying very high. Juet at thie time when "light ahead!" wae the ory from every quarter, Sheriff Scott appeared on the gronnd with an execntion ieened on a judgment in favor of L. L. Lewie, a former euperintendent, confessed by S. G. Lewie, another former euperintendent, acting for the company. The Sheriff made a levy, and the mine is now in charge of a keeper, awaiting the fnrther action of that officer. Thie claim ie eaid to he an old one, and, ae we are told, ite validity ie to he teeted by the courts. Thie ie moet nnfortnnate for the company, ae it will retard work for some weeke, at a time when succeee eeemed assnred. But the end ie not yet. Since writing the above we learn that the delay ie not likely to continue mauy daye.

The Schenectady Mill etarted np on a ehort run of 15 or 20 tone of ore to-day. Five aecays made from the eeveral grades of ore taken ont thie week, gave $18.19, $44,16, $92.16, $87.56, and $292.12, reepectively.

AMADOR COUNTY.

CONVENIENT.—Sntter Creek *Independent*, Oct. 24: The dnmp at the Lincoln mine, where the quartz wagon ie loaded for the conveyance of the ore to the mill, ie certainly a convenient and labor-saviug arrangement and we shonld think that a similar contrivance would be adopted at each of onr other minee. At the end of the track leading ont from the month of the ehaft a dnmp ie constructed of strong lnmber capahle of holding mauy tone of rock, into which the ore ie dumped from the care ae it ie taken from the mine. The qnartz team drives alongside the hase of the dump; a eliding door ie opened by meane of a rope and pulley and the wagon is filled with the rock in a conple of minntee withont any lahor whatever. We were ehown the *modus operandi* of the arrangements yesterday hy Mr. W. A. Stowers, the good na-

tured and graceful driver of the Lincoln quartz claim, and we have no hesitation in pronouncing it a money, as well as a labor saving invention.

To Work Chinamen.—It seems that the work of constructing the Amador Canal is to be done principally by Chinamen. A number of them passed through here to-day, and more are to be sent soon. About three hundred of them are to be put to work as soon as they can be got here.

Work Commenced on the Canal.—Amador *Dispatch*, Oct. 25: The work of finishing up the great Amador Canal has been commenced and is now under full headway. Several wagon loads of picks, shovels, blacksmith's tools and other paraphernalia, were taken up from town last Thursday morning. The number of men at present employed on the work is about 250, which number, we understand, will be considerably increased as soon as workmen can be had. Some of our business men are already beginning to feel the beneficial effects of this great enterprise, and we predict that, ere many months roll around, Jackson will be one of the liveliest towns in the State, as a large scope of very rich mining ground in this vicinity will undoubtedly be worked as soon as water can be obtained.

A Strike.—Satter *Independent*, Oct. 25: We are creditably informed that a strike of rich rock has been made in the Bunker Hill mine near Amador City. The ledge is from 12 to 13 feet wide at the point where it was struck. About 9 feet of the ledge is richer than the rest, free gold being visible throughout this portion. Work is being vigorously carried on at this mine, and the prospects of a very large amount of good paying rock being taken out are very favorable.

Amador Mine.—At a depth of 1,570 feet the ore vein is wide and rich in quality, and it is now an indubitable fact that the quality and quantity of the ore increases as a greater depth is reached. The deepest, and one of the richest gold mines in the world, the Amador has before it a brilliant prospect.

CALAVERAS COUNTY.

Blue Mountain.—Calaveras *Chronicle*, October 25: The latest report from Blue Mountain, received from a well informed gentleman, is a continuation of the flattering intelligence we have already published in regard to the richness of the mines of that district. The Heckendorn pays largely. The difficulties of working the sulphurets of that mine have been removed by Mr. Kohler's patent process of amalgamation. The yield of rich quartz is increasing as work on the mine progresses. At the point now reached the vein is over 12 ft. wide, and the rock pays from $275 to $300 per ton. The Imperatrice and Good Hunter are also proving to be rich. Quartz yielding about the same as the Heckerndorn rock has been struck lately in the Good Hunter. Work is pushed actively on all the leads of the District. Doubtless Blue Mountain will very soon attract the attention it deserves.

EL DORADO.

Taylor.—El Dorado *Republican*, Oct. 18: We are under obligations to Mr. George Wiest, of the Taylor mine, for a beautiful specimen of gold-bearing quartz from the 200-ft. level of that mine. The Taylor mine has long been known as a rich mine, but has lain idle until lately for the wherewith to carry on the shaft. We hope the present managers will succeed this time and place the mine on a par with the best. Thanks George, come and see us.

Mill.—On Saturday last, we visited the new ten-stamp mill recently erected by Messrs. Bisnehard, Varozza & Co. They have just completed it, and were making a trial trip to see how everything worked. Owing to the scarcity of water, they were unable to test it satisfactorily as regards speed and power, but in other respects it worked to a charm. The absence of jarring and shaking attested the fact that great pains had been taken in laying the bed for the battery, and every part is built in a substantial, and, at the same time, a neat style.

INYO COUNTY.

Fish Springs.—John Bell's arastra at Fish Springs is running most of the time on excellent ore, and is doing well. Mr. Honard, Sr., has discovered a fine ledge of decomposed quartz in the vicinity of the other mines, which is considered very valuable. The ore displays free gold in quantities.

Not Flattering.—Late news from Wallapai is not of a flattering character. The best mines appear to be failing at less than 100 feet. We hope, however, the reports of failures in the mines may prove unfounded, for success at Wallapi is success at many other districts in the southern section.

MARIPOSA COUNTY.

Josephine.—S. F. *Alta*: Several rich strikes in the quartz mines of Mariposa county have been reported lately. One is in the Josephine vein on the Mariposa estate; another on the Hasloe, first known as the Fank, and afterward the Coward mine, nine miles east of Coulterville. This mine has produced about $200,000 but has been unprofitable for several years. The present superintendent found, at a distance of 195 feet from the surface, on an incline, a vein nearly three feet wide of rock yielding from $50 to $100 per ton, and has run a distance of 60 feet in it, thus exposing a large body of quartz that will keep the ten-stamp mill running at a profit for many months. Beside, he has not reached the limit of the rich deposit, either horizontally or vertically.

MONTEREY COUNTY.

Marble.—*Pajaronian*, Oct. 25: Recent explorations have demonstrated that a fine ledge of marble crops out on San Vicente Creek about 3½ miles from the coast. The ledge is of the best quality seamed with black, red and blue veins, and capable of excellent polish. The best quality of lime might be manufactured from the limestone in the vicinity. The bed of the creek exposes the ledge for over a mile in length, and the nearly perpendicular walls on either side of the stream are over a hundred feet high. The ledge is separated transversely by the cañon, and in no place has the bottom been exposed. The narrow track or coast railroad would run within a short distance of the ledge, and two or three miles of side track would put the quarry in connection with the railroad or navigation. This ledge is no doubt similar to the lime rock, although of a better quality, of that at Adam's kilns and those of Davis & Cowell. The traces, however, are not continuous.

NEVADA COUNTY.

A Clean Up.—Grass Valley *Union*, Oct. 25: The San Francisco *Chronicle* is usually very reliable in its mining items, but it made a mistake a few days ago when it asserted that the Eureka mine of this place, after a week's run had cleaned up 135 ounces of amalgam. The amalgam weighed 1,375 ounces. The Eureka does not do a 135-ounce business.

Quicksilver Retorts.—Mr. Chapin, of the Excelsior Quicksilver Mine, in the Colusa coast range hills, has ordered a set of retorts made at the Empire Foundry. The ore of this mine is ascertained to yield twenty per cent. of quicksilver to the ton of cinnebar.

PLACER COUNTY.

A Placer Mine.—Placer *Argus*, October 18: From Superintendent J. H. Crossman, of the St. Patrick Company, we learn that the Crater mine, now being worked by the company, is yielding better rock than ever before. On Wednesday they hoisted 14 tons of rock from the bottom of the shaft, at a depth of 296 feet, and crushed it that night, the yield being over $200 per ton. The rock taken out showed but very little free gold, but was literally interspersed with salphurets. The shaft is now down 296 feet and when sunk to the depth of 312 feet the company will drive drifts and commence stoping, which will be in about two weeks. On Friday a clean-up was made after a run of 170 tons of rock, which yielded over $10,000. The rock has rapidly increased in value from the 212-foot level down, and the pay shute, which is in the shape of an inverted V, has gradually widened from 40 feet at the surface to 220 feet at the 212-foot level, and if it increases at the same ratio, will make it 265 feet at the 312-foot level. The ledge at the bottom of the mine is 20 inches thick and well defined with good casings and gouge.

SIERRA COUNTY.

Ditch Operations. — Mountain *Democrat*, Oct. 25: Superintendent Bishop has a large force—upwards of 150 men—at work cleaning out ditches, constructing new flumes and repairing old ones, along the line of the E. D, W. & D. G. Company's works. In view of the probable early approach of winter every hour is made to count and there is little apprehension but that the rainy season will find us well prepared for extensive mining operations.

Richer than Ever.—Operations have recently been recommenced at the Pocahontss mine, and last week a large deposit of ore was struck, richer, if possible, than any heretofore found in that mine. The extent of this deposit has not yet been ascertained, but it is evidently of immense proportions. The development has caused much excitement in that vicinity.

TRINITY COUNTY.

The McGillivray Mine.—Trinity *Journal*, Oct. 25: We learn that the sale of this mine has not yet been concluded, but that while in San Francisco, Mr. McGillivray received a telegram from Dr. Lathrop, who is now in New York, stating that he would be on by the first of November with the requisite amount of cash.

TUOLUMNE COUNTY.

Lady Washington.—Tuolumne *Independent*, Oct. 25: Twenty-five tons of rock from the Lady Washington mine, crushed at the Grizzly mill, near Cherokee, averaged $18 per ton.

As Good as a Quartz Mine.—Some fifteen years ago, Mr. Jack Faxon discovering a soapstone quarry on Wood's Creek, at the west corner of town, conceived the idea that it might prove of value and located the said mine. Sawing out a few bricks, some three years ago, he sent them to San Francisco to be tested in the furnaces of the Rolling Mills. The proprietors being well satisfied with the result—having outlasted four sets of fire-brick, and still holding good—immediately ordered several tons of the same material. The stone is shipped in large chunks, as blasted from the quarry, and remodeled after its arrival in this city. It is delivered at Oakdale for $15.50 per ton. As Antioch brick sells for $75 per thousand—four sets costing $300, besides the expense of rebuilding the furnace—we consider the soap-stone a great discovery. The Tuolumne soap-stone has proved the best of seven different places, the brick standing fire better than any. In fact, so much satisfaction has been given that a thirty-ton order will be shipped in a few days, which will make seventy-six tons altogether taken out and sent below since the opening of the mine.

The Golden Gate Mine.—Their new mill is completed and in running order. The direction of the main vein is N. E. and S. W. and width from 15 to 50 ft., having been crossed but once in the tunnel of 300 ft., and that, some 200 ft. in, showed a width of 18 ft. good ore; and one shute at this point, shows assay value of an average of $400. The developments of this mine consist of a tunnel on a line of the lead 300 feet in length, which has been done in a most thorough and workmanlike manner—it being very capacious and well timbered. Also a shaft from the hill-side some 90 ft. in depth, connecting with a tunnel at a distance of about 175 ft. from its month. At a depth of 65 ft. a new level has been commenced, running north on the vein; and at a distance of 20 ft. shows a good 8 ft. ore breast, and fine looking rock, showing free gold. The mill is a fine ten stamp with all the modern appliances, having free water in abundance, with a wheel of 40 stamp capacity, so stamps can be added as required; they have plenty of good ore already exposed, to supply the present capacity for two years to come.

A Promising Mine.—We continue to hear very favorable reports from the Gem ledge, a comparatively lately discovered quartz lode about two and a half miles northwest of Columbia, Tuolumne county, near the road leading from that place to Valleeito. A shaft has been sunk on the ledge to a depth of ninety-five feet, and the average width of the lode for that distance is about six feet. The walls are hard granite.—The quartz contain both gold and silver and improves in richness the deeper the shaft is sunk. The croppings show that the ledge extends for several hundred feet on either side of the prospect shaft, and rock taken from any portion of the lead is found to contain gold in paying quantities. The owners of this mine are with good reason considerably elated at their prospects, and propose to build an arastra to crush rock now extracted, and will put up a mill in the spring. Should the lead be all that it now promises to be, it will materially increase the prosperity of that portion of Tuolomne county.

Fire in a Mining Shaft.—Union *Democrat*, Oct. 25: The shaft in the Soulsby mine was burned out on Friday of last week, destroying the hoisting works. The fire was not discovered until flames shot up from the shaft endangering other improvements in the immediate vicinity. It is supposed to have occurred from the carelessness of some of the miners leaving a lighted candle near the timbers. Outside of entailing a loss estimated at three or four thousand dollars, it is unfortunate to have new works just completed destroyed, before being put in active operations. Many months were spent in draining and opening the mine, and if not prevented by this mishap, the company would have commenced raising ore for milling the first of this week.

PLUMAS COUNTY.

"A Mine What is a Mine."—Plumas *National*, Oct. 25: During the past three or four weeks, Mr. A. C. Light has taken from his little ledge located on the mountain south of Indian Valley, something over $5,000. The best part of it is that he has pounded it out with a hand mortar, and has plenty more of the same kind of rock left. Mr. Light has recently purchased the little ranch of Mr. Frank Fox, which was in the cañon below his mine, and he will make arrangements to sluice off the ground under the ledge during the coming water season.

Nevada.

ELY DISTRICT.

Meadow Valley.—Pioche *Record*, Oct. 26: Incline 3 has been sunk to the depth of 1,000 ft., where the 10th station is now being opened. When the station shall have been completed, drifting will be commenced from it, and the sinking of the shaft will be continued. The west drift from the 9th station is in 180 ft.; the east, from the 9th, 287 ft.; the east from the 8th, 373 ft. Incline 5 has been completed to a depth of 834 ft. Its bottom, as well as that of No. 3, is in hard quartzite, which, however, blasts well. From incline 7 the west drift at the 8th level is in 504 ft.; the east from the 4th, 104 ft.; the west from the 3d, 110 ft. There has been little or no change either in the character of the ore or in the quantity taken out.

Pioche.—At the old works there are now on the dump 40 tons of ore assorted and ready for the mill. During the week the bressts in the stopes have been very hard. For this reason not so much ore has been taken out as usual. The car-samples of the ore now on the dump give the exceedingly good average of $174.50 to the ton. The new shaft measured 370 ft. in depth yesterday morning. During the past week the contractors made more progress than during any previous period of the same length. They succeeded in going down 25 ft. The bottom of the shaft is still in a shale formation.

Spring Mountain Tunnel.—Three shifts of men continue the work of sinking the shaft, the bottom of which is now 140 feet below the tunnel. It is expected that ledge No. 2 will be cut within 10 or 15 feet from where the men are now working. Ledge No. 3 will then be reached by a cross cut. The indications with regard to the ledges about to be cut are considered very good.

Washington & Creole.—Another winze has been commenced, making three now in progress. These winzes are 1,200 feet apart, and are all in ore. When they shall have been sunk 100 feet, they will be connected with each other by drifts from their bottoms. Stoping upward to the level above will then be commenced. The prospects of the mine are better than heretofore.

Caroline.—The sinking of the shaft continues through hard rock. All the rock through which the men have passed during the week has been hard. To-day will be finished a contract which will make the depth of the shaft 425 feet. Another contract for 100 feet has been let, so that the work will continue uninterruptedly.

Chief of the Hill.—A progress of 10 feet has been made in the cross-cut at the 360-foot level. The rock in the face of the drift has been very hard for the last week, but is becoming softer. A further distance of 12 feet has been run, since our last report, in the west drift.

Chief East Extension.—On Wednesday the sinking of the main shaft was resumed at a depth of 225 feet. The ledge at the bottom of the shaft is regular and well defined. It is, in width, about 3 feet, 6 inches of which, along the foot wall, is rich ore.

Alps.—Work has been suspended for a few days, for the purpose of repairing the engine which is out of order. The appearance of the mine, when the workmen quit, was very promising. The face of the drift was in quartz, showing mineral.

Condor.—On Monday last work was resumed in the Condor mine at the depth of 160 feet. The shaft is being sunk on the ledge, which is three feet wide. Appearances indicate the proximity of a good body of ore at present.

Raymond & Ely.—The number of men at work in this mine has been increased to 225, who take out 100 tons of ore daily. No change has taken place in the aspect of the mine, nor in the character of the work since the last report.

Silver Peak.—The incline is now 345 feet deep. In the west drift, at the 280-foot level, a considerable quantity of very fine ore has been found. In the upper levels a large quantity of low-grade ore is in sight.

Peavine.—The face of the southwest drift at the 30-foot level, which is in 145 feet from the shaft, shows a ledge a foot in width. The ore in the ledge is very good, and the ledge is very well defined.

Bowbay.—A new contract for sinking 100 feet, which is to bring the shaft to the depth of 500 feet, has been commenced. One drift is at present being run from the 3d station.

WSHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Oct. 25: Daily yield 250 tons of ore, 100 of which is being hoisted through the Gould and Curry shaft, and the rest through the company's shaft. It is the intention to continue hoisting ore through the Gould and Carry shaft until a side track of the railroad is completed to the company's damp. The ore body is being breasted out both north and south, and continues to not only hold out, but improves in quality. A winze is being sunk at the 1,200 foot level, which is down 30 feet in fine ore. The raise on the same level is up 35 feet, also in rich ore. A station is being opened at the 1,000 foot level, from which a drift will shortly be started to connect with the up-raise from the 1,200 foot level.

Dayton.—The ore vein at the third station (400 foot level) has been drifted upon north and south a distance of 80 feet, the face of both still being in good ore. The north drift at the second station—320 foot level—has been driven directly along the ore vein a distance of forty feet, when the course of the drift was changed, cross-cutting the vein to the west wall of the ledge, which was reached in eighteen feet from the turn, passing the entire distance through ore. The course was again changed, following the west wall of the ledge, to connect with the winze of the first level, which will be reduced in a very short time.

Crown Point.—Daily yield, 400 tons of ore. There is no change of importance to note of the different ore stopes and breasts on either the 1300 or 1000 ft. level. The main south drifts on the 1400 ft. level has been stopped on account of the great heat and bad air, and an up-raise started to connect with the north winze from the 1300 ft. level, for the purpose of giving ventilation to that part of the mine.

Woonville.—Sinking the incline is making good progress following the ledge and still in ore. The usual amount of ore is being extracted from the face of the north drift at the 300 ft. station. Sinking the new shaft is making fair progress, some little water in the bottom but not enough to in the least impede the sinking.

Belcher.—Daily yield of ore, 500 tons. Incline down 133 feet below the 1300 ft. level in hard blasting rock. The south drift from the 1300 ft. level is in 413 ft. and ore of an excellent quality encountered all along.

Arizona, Utah and Globe.—The main west drift at the 400 ft. station is still driven energetically ahead without change of interest to report for the week.

Succor. — Some very fine ore is being extracted from the east drift at the second station of the shaft in the cañon.

Hale and Norcross.—Sinking the main incline is making good progress, although the rock in the bottom is quite tough and hard to blast. Daily yield of ore 95 tons, mostly from the eleventh, third and second station levels.

Baltimore Consolidated.—A cross-cut has been commenced in the north drift from the main west drift at the third station. The drift south on the ore-body, at the second station, shows the ore to be both widening out and improving in quality.

Silver Hill.—The new pumping machinery is nearly completed. As soon as it is finished, sinking the shaft for a new level will be resumed.

[Continued on Page 284.

The San Juan Mines.

The Denver (Col.) *Tribune* says: We have referred to the discovery of a new gold mine of extraordinary richnese in the San Juan district, twenty-five miles eouthwest of Del Norte. Some incidente connected with the diecovery are of considerable intereet.

It appeare that for yeare, or in fact, from the firet settlement of the district, frequent discoveries have been made of gold nuggets and specimens in the viciuity of the locality referred to. These diecoveries excited a general interest to find out the source from whence they came.

All attempts, however, have proven futile till the 18th of last month, when P. J. Peterson and H. Brandt was so fortuuate as to etrike the regular vein or lead.

The discovery was made toward evening, Mr. Brandt's attention being first attracted hy the glitter of the pure ore itself that was embedded in a piece of rock lyiug at his feet. Petereon was hut a short distauce away, and immediately joined his partner. The two then indulged, we may euppose, in no little exultation.

Without further delay the fortunate miners made good their olaime, selected a few specimens at random and returned to Del Norte with the great news.

Of course the intelligence, backed hy the rich samples, set the town wild, and everybody rushed madly for the new dietrict with the hope of eecuring something.

From Del Norte Meesre. Peterson & Brandt came direct to Denver, accompanied hy Major J. Oary French, an old and well known correspondent of the *Tribune*.

The specimens hrought to Denver hy these gentlemen have produced almost as much excitement here as they have in Del Norte—that is, among those who have seen them.

The eamples of the lead proper vary from an inch to two and three inches in width, and are *literally* the pure gold in mass; perfectly visible to the naked eye and assaying huudreds of thousande of dollars.

Other epecimens taken at random from various parts of the vein, just as they laid on the surface, and which were thought to he of little value, assayed yesterday, at the Mint as high as $36,000 per ton.

Taking all these facts into cousideration, it appears as though this was likely to turn out the richest gold deposit in the known world. The hest judges in our city pronounce the specimens as unequalled by auything ever before known.

Mr. P. J. Peterson is a Swede hy birth, hut has been in our country since he was fifteen years of age. He is a gentleman of fine addrese, pleasiug mannere, and a generous cultivation. He ie now hut thirty-five, and went to San Juau a poor carpenter. He returns, after a comparatively short stay, a millionaire.

Mr. F. H. Brandt is a native of Holstein, but has also been many years in our country. He is an earnest, hard-working, reliable and intelligent gentleman, calculated to win and maintain the friendship of all whose friendship ie worth the having.

These are the fortunate owners of the "Little Annie"—a lead which, if we are not greatly mietaken, ie bound to create more excitement in the mineral and finanoial world than any mine heretofore discovered all the world over.

Mining in Amador.

Under the title "We Must Help Ourselves," the Amador *Ledger* says: It has heen conceded that Amador is the richeet mining county in the State, but its mineral wealth is generally supposed to be confined chiefly to the quartz veins lying so abundautly over the county. This is an error. Time will prove that more gold lies hid in the ancient channels and gravel deposits that underlie our numeroue lava hills, than has ever beeu extracted from quartz-veiue, gulchee and flate. It is known to every practical miner, that channele, once living streams, exiet under the lava hills throughout the oounty, and althongh theee channels have been but elightly explored, yet, wherever they have heen touched gold has heen found in paying quantities, and it is safe to aesert that many of theee ancient channele will prove more productive, if ever reaohed, than have the surface gulchee. Indeed, there can he little doubt that the gold found in the gulohes and flate came originally from gravel deposits nnderlying the lava hills throughout the couuty; and hence, if the energiee of our mining population should be directed toward exploring these hills and hidden channels thereuuder, we helieve new and exhaustlees mining fields would be opened up, and of far more value than ever were our eurface placere. This matter ie worthy the oonsideration of the active business men in the varioue mining towne in the couuty. It will not require a large amouut of capital to drive tunnele into theee lava hills, and wherever favorahle localitiee exist for euch an enterprise, companies should be organized for tunnel operations. Volcana has set a worthy example to other towne in the county, and which example it would be well to follow. In fact, we must help ourselvee, and not wait for foreign capital to develop our mines. We have the gold nuder our hille, hid away in dead channels, awaitiug industry aud enterprise to bring it forth and prove the fact, that, inetead of our placer fielde being exhausted, placer mining hae really scarcely commenced. Companies eimilar to the one at Volcano ehould he formed in all our mining towns, for the purpoee of exploring oue or more of the hills in the vicinity of each town; a single success would lead to the formation of other mining associations, and thus important discoveries made that would give a new phase to the mining interests of the county. Our surface diggings are well nigh exhausted, hence, if new discoveries are not made, our miniug towns, with a few exceptions, must coutinne on the downward grade, but as it is reasonahle to suppose that the gold taken from our gulches and flats originally came from deposits under the hills, if these hiddeu deposits can he discovered, a new and wide field will he opened up, employing as many in the eearch for gold as did the excitemeut of forty-niue.

The American Mining Company.

The Nevada *Transcript* containe the following. If any of our friends wish to see one of the most exteusive and best worked hydraulic claims on the Pacific Coast, we would advise them to visit the claims of the American Mining Company, located at Sebastapol, in this county. These worke furnish an example of what industry, good judgment and skill can accomplish in bringing to light the vast treasure concealed in these mountains. The present eight of these claims is an extensive artificial cañon glittering with houlders, where once stood a high hill crowned with primeval forests of oak and pine. Under this hill have hlasted out of eolid rock vast tuunels thousande of feet in leugth, through which the mountain, loosened hy powder and pick, and hy the means of immense hydraulic pressure, has been sent rolling and foaming into the deep gorge of the Yuha helow. Into these sluices are ewept, indiscriminately, rocks, sand and pay dirt, but the nnder enrrente, an ingeniously contrived eaving apparatue, placed in these sluices and at the mouth of the tunnele allow nothing of value to escape. In these, at the close of the season, the honest miner finds the reward of his lahor, and we are assnred by the smiling faces and good cheer of the American Company that theirs is alwaye a rich reward. This company own good ground. But there is another eecret of success which no one visiting the mine can fail to notice—each one of the share-holdere is a working man. There are no droues in the hive. Here can he found the stalwart Supervisor of the Third Di trict, in checkered shirt and coarse boots, trundling a wheelharrow with ae much satisfaction as though deliherating with the other wise heads at the county eeat. Here too, is Mr. Spooner, the courteous Superintendent, spooning ont the coarser gohs of gold that stick fast in the hed-rock. Believing that work never prospere unless they are with it, each had something to do, and each did that something well. These claims were opened in 1853, and, although conetantly worked, they have increased in extent and value ever since, additions having been made by the purchase of other claims at a cost varying from ten thousand to a hundred and fifty thousand dollare. The main channel extende a mile to the front of their present worke. The company employ ahout fifty men the year round. Water is low now, and they are running only five nozzles of the largeet kind, carrying over twelve thousand inchee of water. Should theee streams continne to play at thie rate for ten yeare, this mine would not then be played out. A trip over theee claims would satiefy any one that the foot-hills of the Sierrae possese attractions found in no other portions of our country.

Lake Mining District.

E D. Town, lately conuected with the Manhattan mill in this place, and a gentleman whom long experience in mining matters hae made familiar with the value of such properties, givee ue eome points of information regarding a new district called Lake District. Situated 22 milee in a southerly direction from Mineral City, Robinson District, and near the liue of roads travelled by the Pioche teams, it is easily accessible to the prospector and partiee in search of mines. The district was originally located by one Tyler, who was firet attracted to the locality by the appearance of the ledge while riding along the road eome distance from the same. We are informed that the formation of the ledge is pure, unadnlterated quartz, and can he traced a distance of six miles, running north and south, with its dip toward the east. The croppings aloug the entire length are large, and, as far as work has progreseed, indicative of an immense lead of pay ore. Mr. Town informe us that he found some piecce of rock which aesayed $273 in eilver, without a trace of base. The district derivee ite name from two large eprings which, from their eize, have been called lakee, affording ahundance of pure water. In the near vicinity of the mines, timber of a large growth abounde in almost inexhaustible quautities. The entire length of the ledge, yet discovered, has been located by the present residents, eome eix or eight in number, and they are all eteadily at work developing their respective locations. From present indications hut little can he said of the permanency of the veins, but that ore of high grade abounds on the surface is a fact settled beyond a doubt. It ie proposed to extract rock as rapidly ae possible and send it to the Watson Company's mill, at Mineral City, for reduction. We shall give information from thie sectiou from time to time which we ehall take paine to give to onr readers.—*White Pine News.*

Cheap Transportation.

At the late meeting of the California State Grange of Patrons of Husbandry, in San Jose, the Committee on Transportation and Legislation reported as follows:

Your Committee, to whom was referred that portion of the "Declaration of Purposes of the State Grange" of California having reference to the subject of transportation and legislation, heg leave to report, first,

On Transportation.

It has been said that "cheap transportation of persons and property is a national necessity." Nowhere can the force of this axiom be more fully realized than here in our favored State. With a territory great in extent, affording within its limits the productions of both torrid and temperate zones, with a climate varied as its productions, and with a population gathered from all parts of the globe, we can readily understand how facilities for bringing producer and consumer together will contribute to our comfort and convenience. Our wheat, our wool, our wines, our fruit, our minerals, all sources of wealth, health and luxury, must be transported either in a raw or manufactured state; to fetch and carry them, so that the greatest good will ensue to the greatest number, is a study well worthy of the political economist, and its solution will remove an oppressive hurden which now hangs like a millstone aroud the neck of the producer of our State. Our present avenuea for trausportation of freight are either insufficient or do not perform their proper work. Our inland water courses are blockaded for months during the dry season by sand hars and shoals. The exorhitant rates in many cases charged for transportation on railroads make the cost of moving our crops to market almost prohihitory, and in years of plenty the producer can scarcely realize the cost of production. These things, with the unjust discrimination sometimes made, cause fluctuations, which at times unduly excite, at other times depress and destroy, the agricultural and manufacturing interests of our State, and have a tendency even to depopulate it.

While we recognize in the railway an effectual instrument to aid in developing the agricultural resources of the State, and helieve that the public interests of the country and its producers would he subserved hy fostering the further development of the railway system, provided such a judicious management can be obtained as will secure equitahle and just treatment in the way of fares and freight to all localities through which they pass, yet we are satisfied that the present system of building and managing railroads is injurious to the best interests of the producer.

1st. In companies having such special privileges granted them as enables them, after obtaining large aubsidiea and stock subscriptions from individuals, corporations aud counties, to depreciate the value of stock to such an extent as to onable an interested ring to secure the entire control of the road and deprive those who aided in its constructiou, by furnishing funds, from having any voice in the management of it. Then giving this ring the power to build and equip the road at a fictitious cost, the profits of which go into their own pockets, and farther permitting them, in order to have large dividends, to compel the producer, consumer and traveler to pay excessive fare and freight on such road.

2d. In permitting the consolidation of what should he rival lines in our State, inasmuch that such action is contrary to puhlic policy in building strong monopolies which defy competitiou, facilitato the charging of exorhitant rates and discriminates unjustly in favor of or against localities, and enahles such monopolies to attain their objects by introducing into our legislative and judicial halls, and hy the use of our safeguards for their own selfish ends, carry out a policy which builds up the carrier at the expense of the producer or consumer.

Farmers should encourage the opening and establishing of new routes, under proper restrictions, and retain controlling interest in them. Canals from interior points to communicate with our navigahle streams should he constructed; narrow-gauge railways, so much cheaper in construction and operation than the present hroad-gange, are well adapted to cheap transportation and would help meet the exigencies required. All farmers, as well as Patrons of Husbandry, should unite in an effort to secure a reduction of freight and fare and charges on inland as well as ocean routes, and withhold their voice, their votes and subscription from all transporting corporations which will not agree that such uniform, equitable rates shall he fixed by the State authorities as will afford a fair remuneration to them and at the same time will not he an oppressive hurden to the producer and consumer.

Another and true way to correct and alleviate the present trouhle and assist the producer of this State would he to create a home consumption for our products by encouraging and drawing to us manufactories. These, hy affording us consumers at home, would do away with all need of transport ation of much that is now surplus. If a moiety of the subsidies hy farmers to railroads in this State, had heen invested in manufactories, our population would have heen so increased, that the homo market for produce would he douhle what it is now. If the demand for traosportation was curtailed this much, the surplus we have to spare would find a ready market at compensating rates.

The aubject of Oceanic and Internal Transportation is ot such a varied nature and of such vast importauce, that your committee have approached it with reluctance. Especially as the whole aubject is now in the hands of the special committee of the United States Senate, who, with a great deal of care and considerable expense, are now gathering facts and statistics to make a report which will, no douht, he made public in time to enahle us to derive as much or more real information and henefit therefrom, than from any report your committee, with the limited means at their command, could posaibly make.

Legislation.

The agriculturists of this aa well as other States, may justly complain of the unequal hurdens imposed upon them for the support of State and Federal Governments, while they receive no more, and in many cases not near so much, care and protection from the Government as other industries; yet the statistics show the producers (we include in this class — the farmer, the stockman, the fruit-grower and the mechanic), either directly or indirectly, pay nearly all the taxes that are required for the machinery of the Government. Our lands are taxed, our stock is taxed, our crops are taxed, our improvements are taxed, and in addition to this we pay most of the tax and tariff which is required by the Government from manufacturers. We pay in addition to the cost of transportation on all articles which are brought from abroad, whether of luxury or comfort, the revenue which the Government receives from their importation.

The capitalist who has his money invested in bonds or other securities, or is engaged in manufactures, compels the party who uses or consumes the same to pay all the tax which is imposed on *him*, so that it matters not to him how excessive or oncrous the tariff may he. All he has to do is to add the percentage necessary to cover thia expense and collect it without diminishing his profits.

The government has fallen into the hands of the consumers rather than the producers of the country, and per consequence a system of unjust discrimination has been adopted and carried out, which makes the producers mere hewers of wood and drawers of water, to their more favored fellow citizens.

This atate of affairs has heen hrought ahout mainly hy the fact that the producers, as a class, have had their time so occupied with the attention necessary to the successful management of the particular industry in which they are engaged that they could not or have not taken that active part in the administration and control of State and National affairs which they should. Demagogues have usurped power; chicanery and fraud have been successfully used to control the masses; party tactics and selfish intrigue have been permitted to usurp the place of hrain and muscle.

The remedy for this is for the producers to aronse from their lethargy, to awake from their slumbers, and not only assist hut carry out the measures necessary to reform these abuses. Let their power he seen, and felt, and heard in every part ot our Government. In the administration of their local affairs, in our Legislative forums, in our Judicial halls. Let the mechanics and farmers see to it that none hut good, honest and true men fill our State and county offices, none hut the true repreacntatives of our interests appear for us either in our State or National capital, men who are closely identified with the bone and sinew of the laud, who have suffered from the same ills as ourselves, who have felt the crushing, grinding power of the monopolies which have weighed us down.

We respecttully submit as the most practical way to accomplish these objects and secure the reforms we need, that such legislation shall he had as will make in each county the District Attorney ex-officio chairman of the Board of Supervisors, with the power to veto all appropriations made hy the Board for the payment of moneys which in his judgment are illegal or not actually necessary for public uses. The District Attorney to he liahle on his official bond for any malfeasance in office while acting as Chairman of the Boards. This, we helieve, would effectually check the extravagant and illegal appropriations so often made, and provide for the impartial action of bodies which combine the functions of the Legislative, Judicial and Executive hranches of government without, in many cases, heing ahle to properly discharge the duties of either.

Again, believing, as we do, that the subject of freights and fares of railroads should he controlled hy the legislature, their right to do so having generally been admitted under these powers which give the States the right to compel common carriers to establish *reasonable* rates of freight or fare (the Supreme Court of Minnesota has so decided, and the statutes of New York and Massachusetts expressly declare it) we, therefore, propose that our legislature at its next session do establish a uniform standard of fares and freights on the railroads and steamhoats of this State, which shall give a reasonahle and just remuneration for the distance traveled and service performed. These rates to he conclusive and absolute, but subject to revision at specified times hy the legislature, and that a commission of three or five taxpaying citizens he appointed by the legislature, whose duty shall he executive and supervisory, to whom shall he referred all matters of controversy growing ont of any illegal charges or arhitrary and oppressive acts on the part of railways or steamers, and who shall see that these carriers comply with the requirmeuts of their charters, and perform all the services for which they were created. The commission would afford protection and redreas to every individual having dealings with the companies, without ohliging them to apply to the courts at great expense or delay.

In order to secure more uniform and equal taxation, we recommend that the duties enjoined upon our assessors he more definite and specific, and penalties be inflicted upon them when it can he shown they have made unfair or unjust discrimination in fixing valuation or assessing land and property in the same locality, or when they consent to receive any special favors from large property-holders or taxpayers, even if it is hut a *railroad pass*.

We recommend that our representatives both at Sacramento and at Washington, he petitioned to interfere in our behalf, and redress our grievances by carrying out the measures proposed, or if the plans suggested are not practicable, or will not have the desired effect, let them devise some other way by which taxation shall be reduced and made uniform and equal; freight and fares he regulated so as to prevent unjust discrimination and oppressive rates; additional facilities for transportation he encouraged and huilt up, and the agricultural and mechanical industries of our country receive more fostering care from the hands of our Government.

J. M. HAMILTON,
T. H. MERRY,
G. W. HENNING.

THE VALUE OF A GOOD WORKING MINE TO THE COUNTY.—The *American Manufactory* gives the following estimate of what one manufactory will do. "One manufactory employing a hundred men will support an additional 500 people. Three hundred familiee will disburse annually, on an average, $250, or $75,000 in the aggregate. Thie money will be drawn into the town from the outeide, where the manufactured goods are consumed, and the interest on this $75,000 at ten per cent. would be $7,500. Three hundred families, too, would require a hundred houses, thousande of pounde of agricultural produce, and thousands of yards of cotton and woolen goods, thus giving health ond impetus to every branch of industry." Now after the same etyle of reasouing what would a good working mine do, employing fifty men daily—a low estimate. They would support an additional, 250 people, making in all 300 people. Single or married theee three hundred people will spend at least $500 each a year in this county, or in the aggregate $150,000. This would all go to the people of the county either directly or indirectly. It would como first to the storekeepers, some of it would then go to the producere, and some of it below for goods. It is fair to presume that at least 10 per cent. of it would he expended on improvements in our midst or $15,000 annually. This is a very low estimate of the value of such a mine to the county. The Patterson mine of Tuttletown where they employ some 20 or 30 men is worth nearly that much to our couuty. Can't some one open up another such mine?—*Sonora Democrat.*

NEW ZEALANN MINES.—In the *Provincial Government Gazette*, published on the 30th of June, the statements of sixteen different gold-mining companies are given. Many of the companiee are well known, and have heeu in active operation for several yeare. The aggregate nominal capital of these sixteen companiee ie £483,800, hut the actual paid up capital is £303,471 18s. 5d. This eum, put out at ten per cent. interest, would give a yearly return of over £30,000. Of theee sixteen companies, nine have not declared dividends. The aggregate amount of dividends paid by the whole of these companies is £48,144 14s. 2d. Of this eum no less than £43,625 was contributed by the Tokatea. As the Tokatea hae a declared paid-up capital of £80,000 the amount of dividends already paid is not a very high rate of interest for the money for the whole period the company has heen iu operation. There is one company mentioned which is stated to he in operation, although it has no paid-up capital.

Useful Information.

Sulphuric Acid and Weeds.—A correspondent of the *Journal of Horticulture* (English) writes: "Take an old blacking bottle, with a wire round it to carry it by, and a stick to dip with. The stick should not be pointed, but should be notched round for an inch or two at the end, the better to hold the liquid. Just one drop quite in the heart of the plaintain is sufficient to cause death and the notched stick will contain at one dip enough to destroy three or four plants. If the acid is good, the work of death can be both seen and heard, for the vitriol hisses, and it burns up the plaintain in a moment. A row of plaintains a foot wide sprang up on a lawn here where an iron fence formerly ran. The owner, seeing at a place he visited the good effect of vitriol, put the hint in practice. The plaintaine were killed in an hour and have never appeared again. It is three years ago, and it is impossible to recognize the line of the fence; it completely burns the roots out. I have tried it on large dandelions with the same result. One of the young gentlemen here amused himself by hunting out the longest thistles he could find to experiment on; the vitriol completely killed them by eating the roots out. One drop will do. Care is required that it does not touch the skin, boots or clothes; it is not safe in the hands of children, but a man or woman with ten minutes' practice can kill plaintains much more quickly than any lad can eat gooseberries.

Vegetable Glue.—Gum Arabic solutions are frequently employed instead of glue and mucilage, but are objectionable on two accounts. First, they render the unsized paper transparent, and if a piece of common printing paper is attached to any dark or printed surface the color shines through, and beside it does not attach it firmly to other paper. Neither can paper be attached to wood or pasteboard. Paper pasted on metallic surfaces with gum arabic usually separates from it in a short time. As a cement for glass, porcelain and earthenware, it is utterly useless. We are informed on good authority that all these disadvantages are overcome by simply adding an aqueous solution of sulphate of aluminum, two grains of the crystalized sulphate of aluminum being sufficient for 250 grains of concentrated gum solution prepared from two parts gum to five of water. The salt named dissolves in ten times its quantity of water, and is added directly to the gum solution. A solution of alum does not answer as well as the simple sulphate of alumina, which can be prepared from alum by precipitating the alumina with ammonia, washing thoroughly on a filter and dissolving in sulphuric acid. The vegetable glue thus prepared will not, of course, ferment, sour or mold, which will be appreciated by those using it.—*Jour. of App. Chem.*

To Measure the Height of Trees.—There have been, heretofore, various plans given for measuring the height of trees, by which a close approximation to the height may be had. One of the simplest and at the same time a nearly correct plan is to take a rod of any given length, say five feet above the surface when driven in the ground so that it will be firm. Make the rod stand perpendicular by means of a plumb line; then, as the length of the shadow is to the height of the rod above ground, so is the length of the shadow of the tree to the height of the tree itself. As an example, if your rod cast a shadow just its own length, the length of the shadow of the tree will be the height of the tree. Or if the rod, being five feet long, cast a shadow seven and one half feet long, and the tree cast a shadow 120 feet long, the height of the tree will be just 80 feet. The rule is to multiply the length of the shadow of the tree by the height of the stick, and divide by the length of the shadow of the stick.

Useful.—Carbolic-acid paper, which is now much used for packing fresh meats for the purpose of preserving them against spoiling, is made by melting five parts of stearine at a gentle heat, and then stirring in thoroughly two parts of carbolic acid; after which five parts of melted paraffine are to be added. The whole is to be well stirred together until it cools; after which it is melted, and applied with a brush to the paper, in quires, in the same way as in preparing the waxed paper so much used in Europe for wrapping various articles. It will be found that stearine is the great key to the perfect assimilation of carbolic acid, with many saponaceous compounds.

Metallic Soap for Canvas.—The following is highly recommended as a cheap and simple process for coating canvas for wagon tops, tents, awnings, etc. It renders it impermeable to moisture, without making it stiff and liable to break. Soft soap is to be dissolved in hot water, and a solution of sulphate of iron added. The sulphuric acid combines with the potash of the soap, and the oxide of iron is precipitated with the fatty acid as insoluble iron soap. This is washed and dried and mixed with linseed oil. The addition of dissolved India rubber to the oil greatly improves the paint.

Three-Horse Clevis.—Fasten the clevis to the plow beam, at a point twice as far from the top of the clevis as from the bottom. The single-tree must be fastened to the clevis at the top, and the double-tree at the bottom. Any good blacksmith can make the clevis. The single horse will only draw his share of the load—one third. Have the double-tree made wide enough to allow space for three single-trees to work well (although only two are fastened to it), and the plow will take "land" enough. Any one who sees this clevis can never be made to use a triple-tree again.—*Country Gentleman.*

Plaster as a Protection from Fire.—After the conflagration in Paris it was generally found that, with good plaster-work over them, beams and columns of wood were entirely protected from the fire. In cases where limestone walls had been utterly ruined on the outside by the flames passing through the window openings, the same walls, internally, escaped almost unscathed, owing to their being coated with plaster. On many such plastered walls the distemper decorations were still to be made out.

To Remove Rust from Finely-Finished Steel.—Rub the rust with any kind of soft animal fat, and lay the articles by, wrapped in thick paper, for two or three days; then, after cleaning off the grease with a piece of soft flannel, rub the spots well with powdered rotten stone and sweet oil, after which the polish may be restored by rubbing with powdered emery, on a soft leather; and the process may be finished with finely-powdered chalk or magnesia.

Good Health.

Wholesome Air.

There are some very interesting facts brought to light in the analysis made in various localities to determine the quality of the air. On this subject an exchange says:

Analyses show that air in open and exposed localities varies in the amount of oxygen, which it contains from 20.4 to 21. The most favorable localities, as on the heaths of Scotland, show the latter; while it is necessary to go underground into a mine to find the former. Well ventilated mines where it is possible to labor, rarely go below 20. These results are delivered from thousands of careful analyses. Cavendish made 500 in the course of his inquiries.

The cursory reader may think that the difference between 21 and 20, and in the per cent. of oxygen in the atmosphere can have but little importance, and is hardly worth inquiring into. It is true that the deficiency named is small when considering in figuring; but when we reflect that while 21 represents the largest amount of oxygen ever found in the best natural atmosphere a candle goes out at 18.50, and life can be barely sustained for a short time at 17.20, the importance of a small per cent. of difference becomes apparent. Even so small a difference as that between 21, and 20.981 is equal to 190 in a million; and if we place impurity in water at that rate it will amount to 13 grains in a gallon. This amount would be considered enormous, if it consisted of putrifying matter or any organic matter usually found in water.

But we drink but a small quantity of water and with such a percentage we might be several days in swallowing the whole 13 grains; whereas we take into our lungs from 1500 to 2000 gallons air each day. Moreover the blood receives such impurities almost entire, very little being filtered out in its passage to the lungs; while the stomach has powers of disinjection and destruction which renders very much of the organic impurities in water harmless. But if we take the air found in the pit of a theater, generally about 20.740, we find that minute analysis becomes a matter of the highest importance.

The senses are bad and inefficient guides to the wholesomeness of air as regards the amount of oxygen and carbonic acid, save when the former is reduced and the latter increased to such an extent that the lungs seem to refuse to expand and the whole vital action is threatened with paralysis. Rooms badly ventilated, which contain less than 20.7 per cent. oxygen, are very unwholesome, and the necessity of taking into consideration the proportion of oxygen and carbonic acid in the sanitary inspection of factories and works is abundantly evident from the results obtained by Dr. Smith.

Mr. Clemson, a French chemist, made public, in 1856, a theory with regard to the presence of living organisms in the atmosphere, so minute as to be almost or quite unobservable by the best microscope, and which organisms exerted a marked influence on health—in fact, were the origin of most diseases to which men are subjected. He also argued that there is phosphoric acid in the air, derived from the successive generations after generations of myriads of these organisms, produced, living and dying in the atmosphere, that such organisms exist and are at work, food for more perfect organisms from the microscopic points of life to the most perfect animal existence. He also entertained the idea that the increased fertility of the earth by being broken up and exposed to the atmosphere, was due to the presence of such animalculæ.

The latest plan for obviating sea-sickness is the following: Construct a large well in the ship; around the center of gravity is the best position for it. This well should have no bottom. The water in it will appear to have a rising and falling motion, but will in fact be at rest, while the walls of the well slide up and down. In this well float a small ship, and you are secure against seasickness. The proposer of the plan calls this "taking a small harbor to sea."

To Keep Teeth Healthy.

It is surprising that so plain a duty as cleanliness of the teeth should be so often entirely neglected. And yet there are people who pride themselves on being scrupulously clean, who forget all about those hardworking servants, the teeth. Dr. Lane has the following with regard to their care:

The great enemies of our teeth are acids. A source of acid is the decomposition of sugar in the mouth, which changes to lactic acid. The saliva of the mouth in its normal condition is an alkaline, and is an excellent preservative. If the enamel is smooth it furnishes no lodging for foreign bodies, but if it is rough, foreign matter accumulates and turns to acid. This, having eaten through the enamel, proceeds inward with a rapid march, and hollows the tooth in a short time if not arrested.

Extreme care should be taken that acids do not remain in the mouth, neither should sugar nor other substances be suffered to undergo decomposition there. The greatest panacea for poor teeth is cleanliness. Thoroughly brush the teeth, not only night and morning, but always after eating. An error frequently made in using a brush on the teeth, is that of drawing it transversely across them, from one side of the mouth to the other. This practice long-continued produce transverse fissures, which finally become so deep that the teeth present an appearance of having been filed into. This transverse brushing also has the pernicious effect of forcing the mucous into the interstices between the teeth. The teeth should be brushed from above downward and from below upward—never from side to side. The inner surface should also be as carefully cleaned, and care should be taken that no particles of food are left in the interstices.

Dark tooth powder should not be used, because it works up under the gums, and discolors the edges. Pure soap is a good dentrifice. A tooth powder, must above all things, be alkaline, and should contain nothing capable of becoming sour, such as the sugar of milk, which is sometimes used. Whenever a tooth powder is praised for rendering the teeth very white, it should be looked on with distrust since it is pretty sure to contain some agent that will attack the enamel. Tooth powder should be so fine grained that when rubbed between the fingers no particle can be felt. As the chief ingredient of tooth powder, there is nothing better than carefully prepared oyster shell or carbonate of magnesia. To flavor it, a small amount of calamus root may be added, which has good effect on the gums. Prepared chalk mixed with a small amount of camphor also makes a good tooth powder.

In the preservation of the teeth, the three following rules should be observed:

1. Careful avoidance of acids and careful cleansing of the teeth with such substances as render acids inert—for example, alkalies.

2. Occasional examination of the teeth, in order that a commencing cavity may be detected in due time and the proper remedy resorted to.

3. Immediate removal of such teeth as are decayed beyond reclamation.

Growing Plants in Sleeping Rooms.

It is a current notion that growing plants contaminate the air of an apartment by the exhalation of carbonic acid during the night. Professor Kedzie, of the Michigan Agricultural College, has been making experiments to test the truth of this view, and gives the results as follows: "Not to leave this matter in the condition of mere conjecture, I have gathered and analyzed specimens of air from a room where the influence of growing plants would be exhibited in a greatly exaggerated form. Thus, instead of taking the air from a room containing a few plants, I gathered it from the College greenhouse, where more than 6,000 plants are growing. I gathered the air before sunrise on the mornings of April 16 and 17. The room had been closed for more than 12 hours, and, if the plants exhaled carbonic acid to an injurious extent, the analysis of air from such a room would certainly disclose this fact. The three specimens of air gathered on the morning of April 16, from different parts of the room, gave 4.11, 4.00, 4.00 parts of carbonic acid in 10,000 of air, or an average of 4.04 in 10,000. The two specimens gathered April 17 gave 3.80 and 3.80 parts of carbonic acid in 10,000, or an average on the whole of 3.94 parts of carbonic acid in 10,000 of air; while the outdoor air contains 4 parts in 10,000. It will thus be seen that the air in the greenhouse was better than "pure country air." This deficiency of carbonic acid was doubtless due to the absorption of carbonic acid and consequent accumulation of oxygen during daylight, since the windows of the greenhouse were closed day and night on account of the cool weather. To ascertain whether the air of the greenhouse had more carbonic acid by night than by day, I gathered two specimens of air in different parts of the house, at two o'clock P.M., April 17. These gave 1.40 and 1.38 parts of carbonic acid in 10,000, or an average of 1.39 parts, showing that the night air contained more carbonic acid than did the air of day. Now, if a room in which there were more than 6,000 plants, while containing more carbonic acid by night than by day, contains less carbonic acid than any sleeping-room on this continent, we may safely conclude that one or two dozen plants in a room will not exhale enough carbonic acid by night to injure the sleepers."

Domestic Economy.

Salt and Milk Rising Bread.

For salt rising, take a half teaspoonful of salt to a pint of warm water and stir in flour enough to make a thick batter. The dish used, which with the spoon should be thoroughly cleansed and scalded, should be a little more than two-thirds full, and set in a warm place until the batter rises so as to fill it. The most common way is to put the dish of rising in warm water and set it where it will keep at quite a warm temperature; but some use a cloth or a paper to exclude the cool air instead of placing in water. The time in which the rising will sufficiently ferment, is usually from five to seven hours, according to the degree of warmth and the kind of flour used.

When "light," take a quantity of flour corresponding to the amount of bread desired and stir in scalding (not boiling) water enough to scald one-third, then add cold water (or milk, which is better,) enough to cool the scalded flour so that it will not scald the rising; put in the rising and stir altogether vigorously until you have a thick batter and put in a warm place to rise. When light and puffy stir as thick as possible with a spoon, then mix with the hands until kneadable, cut off in loaves of a size to half fill your baking tins, knead thoroughly, shape to and put in your tins and again put in a warm place to rise. When the loaves have doubled in size put in a moderately heated oven and bake from one-half to three-quarters of an hour according to size of loaves, and you will have bread as moist, spongy and eatable as fermented bread can be. Bread of unbolted flour can be made in the same way, but is better stirred to a stiff batter and baked in deep dishes instead of being kneaded and baked in shallow tins.

Milk rising and salt rising bread are the same, with the exception that one-half a teacup of new milk is added to the rising for the former and is preferable to all water. As you value good bread and good health, never put ginger, saleratus, or any other useless things that some people deem necessary, into your sponge or rising.—*Rural New Yorker.*

House Vermin.—Cockroaches are the plague of many housekeepers, and yet a little Paris green is death to them. Keep it in a common flour dredging box, label it Poison, and apply it weekly to their haunts. Bed-bugs or chinch-bugs can also be dispersed and utterly routed with this remedy, and both cockroaches and bed-bugs will flee from powdered borax. Travelers should always carry a paper of borax in their bags, and sprinkle it under and over their pillows, if they fear they shall become food to the last named wretches. Sprigs of wormwood will drive away large black ants; and none of them, whether black, brown, or red relish wintergreen, tansy, Paris green, cayenne or kerosene; so if they invade our pantries we can, by a judicious application of some one of these articles, make the premises too unpleasant for them. Fly paper should be kept around the house as early as the middle of May. Put it in every open window, and thus destroy every intruder.

Rice Croquettes.—Half a cup of rice; 1 pint milk; two tablespoonfuls sugar; 3 eggs; a little grated lemon-peel; 1 tablespoonful melted butter; a saltspoonful salt. Soak the rice three hours in warm water enough to cover it. Drain almost dry, and pour in the milk. Stew in a farina-kettle, or one saucepan set in another of hot water, until the rice is very tender. Add the sugar, butter and salt, and simmer ten minutes. Whisk the eggs to a froth, and add cautiously, taking the saucepan from the fire while you whip them into the mixture. Return to the range or stove, and stir while they thicken, not allowing them to boil. Remove the saucepan, and add the grated lemon-peel; then turn out upon a well-greased dish to cool. When cold and stiff, flour your hands and roll into oval or pear-shaped balls; dip in beaten egg, then in fine cracker crumbs, and fry in nice lard.

Tapioca Cream.—Soak two tablespoonfuls of tapioca in just enough water to cover it, all night. The next morning, boil one quart of milk with the soaked tapioca, add two-thirds of a small cup of sugar to it and a little salt. Beat the yolk of three eggs thoroughly, and when the milk has boiled for ten minutes, stir them into it, remove it from the fire, and stir rapidly for five minutes, so that they will not curdle. Flavor it with vanilla; heat the white to a stiff froth, and put over the top of the pudding dish into which you have turned the tapioca; sift sugar over it, and brown for five minutes in the oven; serve it cold. This makes a more delicious dessert than pastry, and can be prepared the day before it is needed.

Tomato Omelet.—Beat up six eggs, mix two tablespoonfuls of flour, with a little butter, and add some salt and pepper. Peel four tomatoes, and chop very fine. Stir altogether and fry. Oyster omelet is made in the same way, substituting a dozen chopped oysters for the tomatoes.

Moths in Carpets.—To prevent moths from injuring carpets, buy half a pound of gum camphor, and that will save all the carpets in your house for a year, by placing a few little crumbs under the edges of the carpets, without moving them.

Building Matter.

There never was a more husy season in bnildiug in San Francisco than the present one; as many buildings are now under construction, as formerly could be boasted of in half a year. Theee are chiefly in the weetern addition, but there is more or less building going on over the whole city. There cannot now be less than five hundred going up, amongst them many which, if constructed of marble, would from the heanty of their architecture and the magnificence of their appointmeute be entitled to be called palaces. In no other city in the world do we find private residences built entirely of lumber, costing as high as one hundred thoneand or a qnarter of a million of dollars. It is to be hoped ere long our citizens forgetting their rather nsedlese dread of earthquakee, will build their private residencee of something more enduring than wood. Besides the large nnmber of fine private residences, there are many splendid blocks of stores and tenement houses. In the hnsiness portion of the city all those buildinge that we have noticed from time to time are completed or nearly so, and some of them preeent a fine appearance. It will not be long before the new Opera Houee begins to give promise of what it will he in a few monthe henoe. The work of getting in the foundatione, etc., ie going on rapidly. The total oost of the buildinge now in oonrse of construction, (exclnding pnblic onee,) is not less than two million dollare, and there are upwards of fifteen hnndred workmen employed on them. We hope to be able to continue to notice that the aotivity now manifeeted will be rather increased than diminished.

THE famone snit of McGarrahan against the New Idria Quicksilver Mining Co., is to come up in the Distriot Conrt at Sau José, on Monday next. McGarrahan's claim is for possession of the mine and $5,000,000 damages.

THE Exchequer mine at Cherry Creek has been sold to parties in this oity for $32,000. Thie is the property known as the Rye Patch Consolidated, and is being developed with a five etamp mill.

THE ATLANTIC AND PACIFIC TELEGRAPH CO., has added 2,000 miles of wire to ite telegraph eyetem during 1872, and has made large additione thie year. Is now constructing new lines and proposes to oontinne extending.

Encourage Inventors.

At the last meeting of the State Board of Agricnlture, two new departments were added to the preminm list. One is to he devoted exclnsively to California inventione and the other to articles produced and exhibited by youths. That this a step in the right direction no one will deny. Similar features were adopted at the St. Joeeph Industrial Fair held last month at St. Joseph, Mo. The Board of Directors of that association thonght that patentees and owners of patents deserved more than a passing notice at Expoeitions, and held out special inducements to inventors and owners of patente only to exhibit their inventions. Inventors were allowed to advertise in the building and gold and silver medale were offered for the hest and moet useful of specified inventions. Whether quite so much encouragement to inventors will be given by the State Board is doubtful, bnt we are glad to see that the California inventors will hereafter be recognized as a distinct class and will be able to gain premiums when merited.

That youthful inventors should also be enconraged is eminently correct. Tbey are the ones to whom the nation will look during the next few generations. When a boy exhibits preoosity in this direction, his efforts shonld be encouraged in every poseible way. The days have gone by when the pnblic fail to appreciate new things of valne, and if an inventor patents anything of real utility there is little danger but that he will find some one to introduce it. The tronble with a good many inventors, however, is that they think their articles are of real value, when perhaps they are too complecated or expensive ever to merit nnivereal introdnction, and are therefore of little valne. Advioe on this eubject is generally thrown away, unfortunately, for the inventor has probably studied np his subject so mnoh and epent so mnch time npon it that he naturally dislikes his talents to be depreciated and the value of his invention qnestioned. Consequently he looks npon the snbject from one side only and grumbles because the community fails to appreciate his efforts.

Our State Fair has never been np to the work of what it should he in relation to mechanical or industrial exbihitione, and has come to be looked npon more as a horse-racing institntion, than anything else, by a large portion of the public. Conseqnently it is only patronized by a certain class. It is argned by the managers that it is necessary to devote a great deal of time and money to the speed programme, in order to create interest enongh among the people to make the institution self-snpporting. Because they bave devoted so much time and money to this department is prohably the reason it wae necessary to oontinne it. The faire of the Mechanics' Institute in this city are always very well attended, and pay well; bnt the reliance is placed mainly on the mechanical display to draw people. Of conrse many come merely to promenade and eee the crowd and the pictures, or to lieten to the fine music furnished. But thousands visit the machinery department, and that is where the main interest centere.

Horee races are perhaps very well in their way, and suit and entertain a certain class of people, but the majority of the people care very little for them really, while they are at the eame time somewhat excited on the snbject while a race is in progrese. We are sure, however, that the recent action of the State Board, in adding to the premium list a department devoted to California inventions and another to articlee prodnced and exhibited by yonths, will be of much more benefit to the people and to the Fair, than if a hundred times the amount had been set aside to angment the "speed" department. Enconrage inventors and inventions as mnch aa possihle, and labor-saving machinery will be incteaeed and improved. Incite an interest in our youth to develop their mechanical ingenuity and we assist a class who will be of benefit to our children. Give inventors a chance not only to show their articles but to dispose of them, and it will surely bring abont beneficial results not only to our State but to a olass of people in much need of assistance.

A BED OF COAL hae been found abont 15 miles from Walla Walla, which promises to be of great importance to that section. It is said that this eame material was etruck in 1863 bnt it attraoted no attention, as the existence of coal in that part of the country was not euspected.

Vein Geology of California Gold.

It can hardly be necessary for practical purposes to enter into the question so tenaciously argned by Murchison and others since 1849, of the predominating Palæozoic, or Mesozoic (the ancient or middle) age of our planet's gold bearing rocks. Geologists will strain (legitimately) to deduce a law, where they are sure they have fonnd a repetitiou of what the prospector designates as his "indications."

Such indications had been observed by Murchison as seemed to place the gold-bearing rocks of all the gold-producing conntries known, uniformly in the form of elates, into the dark ages of geological history.

But as checkere will range in line four different ways, so may the trnth. The primary indicatione, and the secondary indications, or results of the truth, can be easily distinguished; the latter are stars of reflected light. They are echoes, or caroms of the firet. The law of gold distribution is a broader one.

Of the fifty or sixty elementary substances to which chemistry reduces all matter, gold, one of the most independent of all alliance or mineral intermarriage, and silver the next following in tractability, once it is gotten, are now believed to be ae truly ae iron and olay and quartz, universally distribnted. Silver ie found in eolution in sea water, the world'e universal envelope, and in all countries pretty much the world over. Gold, thongh more scarce, is also fonnd in all countries. It has been found crystallized in veins and precipitations helonging to all geological ages, including even, it would seem, the Post Tertiary in California. Gold and silver are both soluble in the natural waters of the earth. They are extracted from their ores in California and Nevada in fact, largely by solution, or "in the wet way."

Going back to the palæozoic, or dark ages of geology, and remembering the high specific gravities as well as the firet choice of affinity of these metals, we should expect to find all the gold that there was within eome vertical miles of the eurface disseminated through the semimolten azoic mud which geology tells us of, arranging iteelf and finding its place as truly in accordance with the lawe of gravity and affinity, as do gold, pyrites, quartz, and soil now in the sluice or cradle of the washer.

But chemical affinity or solution was enough to prevent all the gold and eilver we now obtain from "going to the bottom," either of mud or sea, in proportion to their simple gravity. And along with the fluvial replacements of material attendant upon the everlasting rising and einking of lands, chemical affinity or solution, has kept thie gold and eilver moving, ever since, wherever water moves—precisely like all the rest of the 50 or 60 elements of matter, and conforming as faithfnlly to the laws of phyeics and chemistry, that govern all matter.

Thie may be taken as a reeume of best judgment on this subject of the most noted mining geologists and miners in older mining countries, where the vein geology of silver and gold has been stndied a thonsand years.

Of course the "indicatione" of this law can be eeen abnndantly. We find rich silver and gold veine on the eummit, and on the eastern slope of the Sierra Nevada, not merely in the middle age slates, but (in Nevada, Waehoe, Alpine and Esmeralda counties) in the comparatively modern volcanic rocks.

We find gold not only in the "dark age" (Silurian) slates of the Ural and of Auetralia, hut in the "middle age" (Jurassic and Triasaic) slatee of California, and even in the pyritee—possibly mechanically intermixed—of the extinct Pliocene rivere of the Pacific Slope.

The latter occurrence has been repeatedly reported in the pyrites that cryetallize on the carbonized wood, found in placer mining; but we are not assured of a sufficient degree of care having been taken in the test, to exclude all possible mechanical admixture. Preeumptively we know of no reaeon to doubt the statement. Some of the placer pyrites in Nevada and Sierra counties, after ordinary separation by specific gravity in water, are certainly rich in gold.

The Jnrassic and Triassic mude were no sooner deposited than they were distnrbed. The Sierra Nevada began to rise before the Cretaceoue rocks on their flanks (near Shasta, Folsom, etc.) were deposited—eince we see the latter lying nearly horizontal, on the nptnrned edges of the slates.

In the usual natural method of surface oscillation that caused the principal mountaine and valleys of the globe, the slate-muds must have been sinking and piling np thicker and thicker, at the same time that the axis of the Sierra wae rising. This much we may infer from the fact that the valley of Alta California is a valley of depression. The coal mines of Mount Diablo and Corral Hollow will easily convince us of the latter, by showing how their veins, on the top of the Cretaceons, pitch under San Joaquin Valley, where they have been aleo explored, and are about to he worked. Veins are cracke. What etronger evidence then ie needed of the age of the gold-bearing veins of the Sierra, than that of their general parallellism to the axis of uplift and depression?

The True Road to Success—Patrons of Industry.

It hae been snggested that if the mechanics of this conntry wonld unite in eome organizatiou, similar to that of the Patrone of Hnshandry, excluding therefrom all direct action in political matters, and shutting out all such from their conncils as make politics a trade or a specialty, mnch more could be accomplished for that branch of industry than is now heing done or can be reached by the eemi-political organizatione now in vogue among that class of our people. Our brethren of the hammer and plane have labored much longer to obtain their just rights, through the aid of co-operation and co-organization, than have thoee who earn their living by the spade and the plow. While the latter have as yet had but a single year of earnest, active work, we verily believe they have accomplished more (or at least will have done so within another year) than the former have in twenty years.

It is interesting to notice with what intense interest the development of the Farmers' Movement, as it is sometimes called, is watched by politicians and leading men everywhere. The opinion ie very generally expreesed that it possesses an iuherent power and vitality which promise large, most important and satisfactory results, not only to our own country, but to the world at large. Millione of eyee are turned towarde it from abroad, anxiously inquiring of the purposes, plane and methods of action adopted by the Patrons of Hnsbandry.

To our hretbren of the shop we wonld say:—Act wisely and honestly. To be permanent, any reform mnet be based upon honesty and mutual confidence. Look into yonr organizatione, and see if there is not something radically wrong. To effect a thorongh, radical reform, the reformers themselves must he circumepect, and begin the work of reformation in their own persons, their families and their class. Evil-minded men and men who, in common parlance, "have axes to grind" are but poor helpers in such work. So are those who are lacking in moral stamina, in the eyes of the community. Better do without them.

Why may we not have an Order of "Patrons of Industry" as well ae "Patrons of Hnebandry," working separately, but in harmony, and for the eame end, both based upon the same general principles—both laboring for social, commercial and political reform, and for honeety, economy and pnrity in every official, commercial and social relation, and both laboring to secure this end by the eilent hut all-powerfnl lever of moral force alone?

Nearly one half of all the adults in the Union are eugaged, either directly or indirectly, in agriculture. If to that number we add the great maee of the mechanics of the land, and let the better portion of this vaet army be organized so ae to readily co-operate in every desired reform—they would present a front so formidable ae to make a short end to bad men forcing themselves upon the people throngh corrupt partiean nominatione. No party under such a condition of thinge would presume to present for the suffragee of the people any bnt thoee whose records were nnimpeachable. How much better and nobler to stand thns as the controller and elevator of all parties, than to be recognized as the leader of bnt one. An organization which admits politicians and partisan politics into ite councils, contains within iteelf the snreet seeds of disorganization and dissolution.

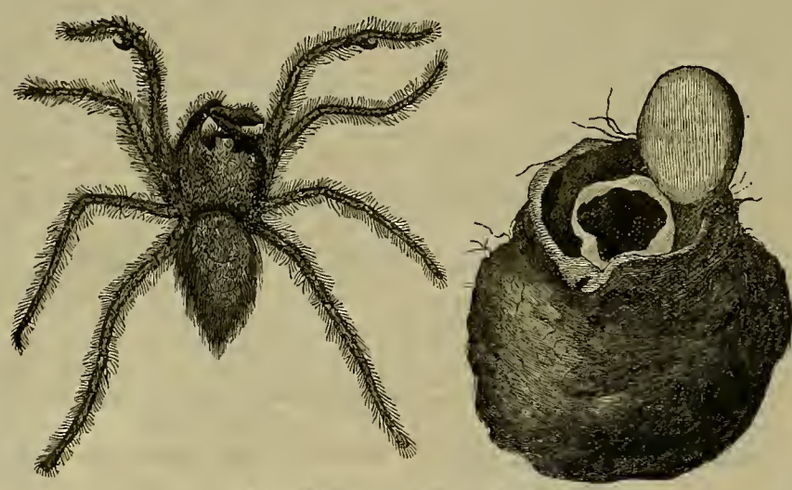
HOLT'S MAP.—There ie no call that we are aware of for repnblicatione from worn out and retouched plates of maps, that were poor indeed when they made their first appearance years ago. The latest edition of Holt's Map of California and Nevada, compiled by Charles Drayton Gibbes, C. E., ie a *bona fide* and very valnable map of this and onr sister State, which, as a specimen of drawing, engraving and printing, surpasses anything heretofore pnbliehed. It is also the most acourate in every respect, and has compressed within ite limits a wonderfully large amount of information, snch ae is reqnired by residents for office nse and constant reference, as well as by etrangere, who are not familiar with this part of our country. All exieting official and other eonrces of reliable information, have been resorted to, and ite accnracy is affirmed by the Government and railroad engineers and local officers, most of whom have been applied to originally to supply information, to correct the draughts before pnblication, and since the appearance of the first edition to make all necessary additione.—*Alta.*

The Tarantula.

The Tarantula, *(Aranea tarantula)* is so named because supposed to be originally a native of Tarentum, Italy, but there is no reason why it should not equally well be termed a native of California. Here it occurs of three times the size attained in Italy. There can be no doubt that each variety belongs to the same genus as the common spider. It may differ in size and habits, but its organism is in all respects similar.

A short time since, Mr. Wm. C. McDougall, of Chinese Camp, Tuolumne Co., left at our office a specimen of this attractive creature, of which we now present an illustration. The body is composed of two parts, united at the thorax, nearly midway between the head and the abdomen. It has eight legs, four on a side. Between the fore legs there are a pair of sharp and serrated nippers, which are used very rapidly when about to seize upon their prey. Between these, again, and somewhat beneath the nippers, are two horny, sharp and hollow fangs, curved inwardly, through which a poisonous fluid escapes, when attacking an enemy. Each animal of this species has six or eight eyes—generally the latter number—which are variously distributed in the different genera. Every portion of the body is covered with a soft downy hair, of a dark slate or chocolate color. Under the extremities of each of the fore-legs there is a claw, or hook, which is used to open and close the doors of its habitation. The propagation of the Tarantula, as of all other spiders, is effected by means of eggs, which are carefully enveloped in a cocoon of silk. They subsist principally upon flies and other insects that may chance to stray too near their dwellings. The Tarantula is very expert in the capture of its prey, which it drags to its nest and devours at leisure.

The nests are holes of its own construction, some of which are closed by a trap-door, which renders them difficult to find, and affords a protection to the ingenious constructor. The trap-door is wider externally than internally, or slightly conical, and is so arranged that on the entrance or exit of the spider, it closes automatically. Near the margin of the inner side of the lid and opposite the hinge, the Tarantula forms a series of small holes, to enable it to insert its claws in case of an attempt to raise the lid from without, but if a knife be inserted so as to run beneath the Tarantula and then lifted up, the deceived animal, circumvented in this unexpected manner, suffers itself to be captured without opposition, and yields unconditionally. We have also heard of a method, practiced sometimes by boys in the country as follows: When the lid has been successfully raised, a looped bit of string is offered the Tarantula, who, on seizing it, is lifted out of his nest and becomes a sadder if not a wiser Tarantula by being deposited in a tin can by the triumphant juvenile.



THE TARANTULA AND ITS NEST.

A Long Prospecting Trip.

A party of prospectors, five in number, have been since September, 1872, examining the country northwest of British Columbia. They visited Omineca river, Peace river, Half-way river, Nelson river—prospecting all along for gold, but found no gold until they arrived at the junction of Nelson and Liard rivers, where they got a few colors to the pan, but nothing to pay for working. They then came down the Liard to Mackenzie river, down that 200 miles to the mouth, then up Peel river to the summit of the Rocky Mountains, recrossed the mountains to the west side, carrying their boat until they came to the headquarters of the Rat river, down which they came to Fort Yukon, on the Yukon river, arriving there on the 25th of July, 1873.

The members of the expedition write to the *Alta* that the country through which they traveled shows few indications of gold or silver. In all their journey they saw very little quartz to speak of, most of the rock being limestone, sandstone and chalk. These men must have traveled some 1,500 miles during their ten months trip, carrying their boat and a year's provisions, without any draft animals, depending on boat and sled. They started originally from the Omineca mines, and must have had an adventurous trip. The same men are now about to prospect the head waters of the Yukon river.

The names of the men in the party, as given in the *Alta's* letter, are A. S. Kanzler, G. W. Finch, Fred. Hart, Samuel Wilkison and A. Harper. They most assuredly deserve better success than they have met with in their arduous search for gold and silver. Men with the enterprise shown by this party must, however, be successful in the end, as they will keep on until they do find something. The whole expedition was undertaken at their own expense, but of course if any gold mines are found they will make the fact public.

Patrons to the Relief of the Workingmen.

Active and practical steps are being taken by the Patrons of Husbandry at the West, to aid the working men of the East by placing Western productions more immediately before Eastern mechanics and other consumers, without the intervention of the present expensive circumlocution of middlemen. There is no reason why all such productions may not be shipped directly from Grange agents to agents appointed by the mechanical associations of the various Eastern cities to receive and distribute them from proper storehouses directly to the consumers as they are wanted, and at wholesale prices. The commissions of agents so appointed would add to the original cost and freight but a tithe of the percentage now charged.

Propositions have also been made, with the same benefit in view, to employ the capital of Eastern mechanics now locked up in savings banks, where it is of but little use, for moving the Western crops to the Atlantic seaboard, for consumption there, and for shipment to Europe. In this connection the New York *World* recently published the following interesting item:

In the Workingmen's Lyceum which recently met at the Cooper Institute, a proposition was made that whereas millions of bushels of grain are locked up in the West for the lack of currency, and millions of currency are shut up by Eastern workingmen in their pockets and the savings banks, the workingmen's societies should choose reliable business men for treasurers, put a large portion of their money in the hands of these treasurers and say to them, "Move this grain and other food produce into our cellars and garrets to an amount sufficient for our winter's use." Thus shall we supply ourselves with necessary food and unlock a large amount of produce and greenbacks. J. B. Hodgkins, late Secretary of the Erie railroad, was suggested as a friend of workingmen who would be a fit man to be trusted with funds to begin the work, and he was invited to address the Lyceum and the citizens generally, upon the remedies that should be adopted in this crisis.

There is no doubt but great good may and *will* yet come from the co-operative action of the Patrons of Husbandry and the various mechanical associations throughout the country. Their interests are mostly identical, and the two classes comprise the total of the great producing army of the Republic. Why then should they not work in harmony for a common end?

ACCURATE WORK AT SUTRO TUNNEL.—Connection was made on the 27th of October, at 11 A. M., between shaft No. 1, and the mouth of the Sutro Tunnel. The distance between the mouth and the shaft is 4,884 feet. Shaft No. 1 was sunk 21 feet from the line of the tunnel, and a drift run to the line, when tunneling was begun. The surveys were so accurately made that the grade hit within half an inch, and the line within seven-eighths of an inch. Mr. H. Schuseler, engineer in charge, formerly Chief Engineer of the Spring Valley Water Works, telegraphs to Mr. John Roach, Instrument Maker in this city, and says much of this accuracy is due to the perfection of the instruments used, which were made by Mr. Roach. By reading an article in another column of this issue, on the Sutro Tunnel, the difficulties of the undertaking will be apparent.

Order of United Mechanics and Grangers.

Joint Action Proposed—The State University to be Examined—Joseph Arch Invited to this State.

The Mechanics' Deliberative Assembly, having accomplished its work in preparing bills for labor schools and training ships, now desires to unite with the farmers and look into the workings of the State University. It is claimed that the departments of agriculture and mechanical science deserve a more prominent place in the management of that institution. The Joint Committee of the Assembly and State Grange will be a formidable body, considering the backing they have to sustain them, and their strength of constituency will command the attention of the Legislature.

The Joint Committee publishes the following correspondence:

Winn to Wright.

Hon. J. W. A. Wright, State Lecturer, etc.—Dear Sir:—The interests of all producing classes are identical, and there are substantial reasons why the Patrons of Husbandry and the Order of United Mechanics should unite their influence in obtaining necessary legislation for the benefit of both institutions. We are informed that your order has appointed a Committee to inquire into the condition of the State University, with a view to making it produce more good to the industrial classes. The Mechanics' Deliberative Assembly has elected Hon E. D. Sawyer, Hon. C. C. Terrell and M. J. Donovan a Committee for a similar purpose. Judge Sawyer is the Chairman. * * *

I have the honor to be your obedient servant, A. M. WINN, Pres. M. D. A.

Wright to Winn.

GENERAL A. M. WINN—Dear Sir:—Our Committee of the State Grange on the interests of the University will gladly avail themselves of the opportunity to confer with the committee appointed for the same purpose by the Mechanics' Deliberative Assembly. We are satisfied our purposes are identical, and wish to coöperate cordially with your association to secure the mutual interests of our industrial classes. My co-workers in the committee are W. H. Baxter of Napa, and O. L. Abbott of Santa Barbara. Yours respectfully,

J. W. A. WRIGHT.

San Francisco, October 23, 1873.

According to agreement, these gentlemen met at Judge Sawyer's office and had a very pleasant and satisfactory interview. The Executive Committee of the State Grange will meet in San Francisco on the 11th of next month, when, in all probability, the committees will make to their respective bodies an agreed report in relation to the University, and ask for a permanent Committee of Conference to act together during the session of the Legislature.

These committees were raised without any collusion of the two orders, and were brought together by publication of the committee of the Assembly. This is an important movement for the future of the producing classes. Mr. Wright is a man of ability, and having served as the Master or chief officer of the State Grange, is well prepared for his duties as Lecturer. His labors have taken him off into the country, but he will try to be here at the meeting with the Executive Committee.

The State Grange has invited Joseph Arch to come to this State, where he will find ample room for all of his agricultural emigrants. The mechanics will no doubt unite in this invitation.—*Call.*

SCHELL CREEK MATTERS.—The Eureka *Sentinel* of the 26th, says: In receipt of telegraphic information from Schelburn that the new mill erected by the McMahon Company went into operation yesterday morning. The machinery moved off smoothly and gave satisfaction to all concerned. E. B. Dickinson, late of this place, has been appointed Superintendent of the company.

Quicksilver.

When we read of the discovery of so many new quicksilver mines and the rapid development of so many more, with accounts of the production of certain others, we wonder why the high price of $1.10 per pound is kept up, and why the production is not larger. According to the *Commercial Herald*, for the first nine months of this year, we have exported by sea 3,205 flasks, valued at $228,560, of which 1,758 flasks went to Mexico. In the first nine months of 1872, 9,383 flasks, valued at $613,257 were shipped, and in the same period in 1871, 14,603 flasks, valued at $805,905 were exported.

We do not know what the home consumption amounts to, but it must be a very enormous burden to our miners to pay the exorbitant prices now ruling. The New Almaden mine is said to be producing only about 800 flasks per month the new Idria about 500 flasks, the Redington 350 flasks, the Great Western flasks. Quite a number of other mines turn out a limited quantity per month, but still the price is high. We see by the Colusa *Sun* that the Chapin mine is now taking out a great deal of rich cinnabar, and thinks that this is the neatest strike of quicksilver that has been made in the State. The *Sun* thinks that the quicksilver mines of that county will be the best in the world. The region where it is found is south of Wilbur Springs. The veins already opened are doing well, and with imperfect works they have more than paid expenses. Extensive smelting works are about to be put up and the mines systematically opened.

The steadily increasing price of quicksilver exercises an important influence on our mining interests, and its production, at a cheap rate, is a matter of great interest to our mining population. Still, cheap production seems to benefit no one but the men who control the sale of the product. We possess in this State the broadest fields of this necessary article in the world, and this coast uses more of it than any other locality—and we may add we have to pay the highest price for it too. Last year we had to pay 85 cents per pound, and thought the figure a high one, and now we have to pay $1.10 per pound. It is absolutely necessary for the purposes for which it is mainly used, and for amalgamating particularly, where is is now used with a sparing hand, a more plentiful and cheap supply would be a material benefit. It is greatly to be hoped that the prospectors now out will find as many more mines as there are now, and that competition among them will bring the price down to a reasonable figure.

AN ORIGINAL and noteworthy conception appears in connection with the invention of Mr. J. Berger of Manchester, Eng., for improvements in the generation of steam, in economising the heat contained in waste steam, the essential principle of which consists in the use of fluids, whereof the boiling points are higher than 212° Fahrenheit, for the absorption of the heat of waste steam, and applying the same for super-heating the steam from the boiler.

QUICKSILVER MINE.—Capt. R. Battereby, the Mining Engineer, tells us that he has had placed in his hands for sale some quicksilver property of surprising richness. It is in one of the counties north of this city, and has been worked only a few months. According to his account of the mine, the deposit is 25 feet wide and contains large quantities of perfectly pure quicksilver mingled with the debris. Particulars may be learned by those interested, by calling on the above-named gentleman, over the Hibernia Bank.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., October 24th, 1873.

FOR WEEK ENDING OCTOBER 14TH, 1873.*

AMALGAMATING PAN.—Ira S. Parke, Virginia City, Nev.

APPARATUS FOR COMPRESSING AIR.—Richard S. Pardee, San Diego, Cal.

DIVINER NUT DEVICES FOR FEED SCREWS.—Frank A. Huntington, San Francisco, Cal.

BOTTLE CORKING MACHINE.—James Armstrong, San Francisco, Cal.

LUBRICATOR.—John M. L. Power, Port Discovery, Washington Territory.

LOCKING LATCH FOR DOORS—Edward Halsey, San José, Cal.

STIRRUP.—Nels. C. Thompson, San Francisco, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

By Rail to Bullionville.

The Nevada Central Railroad.

An erroneous opinion prevails in some quarters in regard to the Nevada Central Railroad, connecting the mines of Pioche with Bullionville; and we regard it as a duty, as well as a pleasure, to set the railroad right before the public. In order to report understandingly about the road, an enterprise in which our people have a very great interest, we rode down and back in the cars yesterday, and found a very marked improvement in the road since we previously inspected it. The train left the depot here at 10 o'clock in the morning. In the train were nine ore cars and one passenger car, the latter capable of accomodating 30 passengers very comfortably, although there were only about 20 persons in the passenger car, exclusive of the officers of the road. The cars now used were constructed under the direction of Mr. Nesbitt, Superintendent of the road. The engine is of ample capacity, and brought the train up the steep grade of 192 feet to the mile without difficulty. At present there are but 460 feet of trestle-work on the whole route, and it is Mr. Nesbitt's intention to dispense with even that amount, and to straighten the line very materially. The trip from Bullionville to Pioche was made in an hour and a half; the distance from the Raymond & Ely mine, where the cars are loaded, to the mills at Bullionville is just 21 miles. Two trips down and back are made daily, making 84 miles in all. The public may rest assured that the road is in good working order, and perfectly safe. Mr. Nesbitt, the Superintendent; H. C. Chapin, bookkeeper, and C. R. Taylor, conductor, accompanied the train yesterday, and each manifested a lively interest in the success of the enterprise and a determination to exert all their energies to make it a complete success.

Bullionville.

The several quartz mills at this place, together with the machine shop of the railroad company, make it a very busy and lively little place. The mills and foundry have so often been described in our columns that we need not repeat anything in regard to the admirable working of both mills and foundry. Mr. Vickery, foreman of the foundry, gave us all needed information in regard to it. From him we learned that the company propose building a new foundry a quarter of a mile from the present one, and that a track leading to the new foundry will be constructed and all trestle-work will be dispensed with.

Want of time prevented us from examining the mills, which, however, are all doing good work, and which, though so often visited by us, are never without interest.

The Canon.

No one can ride by in the cars from here to Bullionville without being profoundly impressed with the beauty of the scenery in the cañon, for a distance of about four miles. The rugged mountains on either side, green grass, brooks of clear running water, and flowers of every hue, render the cañon sublimely and impressively beautiful.

Another Engine.

Yesterday afternoon Mr. O. R. Ford, an engineer, connected with the company, arrived from Toano, from which point he arranged before leaving for the shipment to Pioche of a first-class 20-ton locomotive for the Nevada Central Railroad.—*Pioche Record.*

The Polaris Investigation.

A dispatch from New York says: The *Times*, in its story to-day of the "Polaris" investigation, says Mr. Manton denies absolutely that he ever had any suspicion of foul play in the death of Captain Hall, or that he ever, to the best of his knowledge and belief, told any one he had, or gave any one reason to suppose he had. When Dr. Hall returned from the sledge expedition, Dr. Bissell was employed in the observatory about two hundred yards from the "Polaris." As he saw Dr. Hall and party approach, he went down and greeted and shook hands with them, and then returned immediately to his work at the observatory. Dr. Hall and party went to the vessel, and all partook of some coffee, which all the crew of the vessel had previously drank. The coffee was prepared by the cook, and was given to the party either by him or Joe or Hannah. The party were unaffected by the coffee, except Dr. Hall, who was immediately attacked with vomiting. After vomiting, he fell into a state of insensibility. It was about half an hour after the return of the party when Bissell was summoned from the observatory, and found Dr. Hall already in a comatose condition. When Dr. Hall revived from this state of insensibility, it was found that his left side was paralyzed. This is considered by medical men an absolute refutation of the charges of poisoning. The suspicion that Dr. Bissell caused the death of Hall is baseless, as it undoubtedly is felt by his friends, many of whom were also warmly attached to Hall, to be most harsh and cruel. The symptoms and medical treatment of Hall have been submitted to the most eminent medical men of the country, and by them his death has been unhesitatingly pronounced to have been due to natural causes, and the treatment employed by Dr. Bissell is endorsed as exactly that which was required, and the only treatment proper under the circumstances.

Golden Smelting Works.

This important industrial enterprise, says the Colorado *Miner*, is now in full tide of successful operation, with a capacity for reducing ten tons of ore daily. Messrs. Bagley & Sons, the proprietors have spared no expense to make this establishment complete in every respect; and Mr. West, the Superintendent, the originator of the system of reduction and separation in use, has brought the several operations to such perfection that he is ready to treat any ores that may be brought him, no matter how low in grade, so that they contain a fair percentage of lead.

When the ores are delivered, they are crushed and carefully sampled, and then assays are made to ascertain their value. After this is ascertained, the prepared ores are mixed with appropriate fluxes, which vary according to the character of the ore, and are then roasted, preparatory to smelting. When the mass is drawn from the roasting furnaces it comes out in a semi-fluid condition, of a cherry-red color, but in consistence about like soft dough. This is now in a proper condition for smelting. The slag from the blast furnaces is drawn off into pots and wheeled away, when the molten lead is run out into a pool. On the surface of this pool the copper cools and is skimmed off, and the lead is then ladled up into moulds. The copper is subsequently treated by a process which we cannot fully describe in a brief article like this, but so thorough is it that all the lead and silver contained in it are separated by a series of chemical baths to which it is subjected.

The lead bars, as they leave the pool, contain proportions of gold and silver varying with the richness in these metals of the ores treated. The lead is again melted in a furnace where a certain metal is added which immediately combines with the precious metals, leaving the lead comparatively free. The clean lead is then run into bars for shipment, and the matte containing the precious metals piled up for subsequent treatment. "Matte" is perhaps not the technical name for this combination of metals, but the reader will have to accept it for want of a better term. It is a metallic mass of great value, and far more beautiful than either pure gold or silver—varying in color from a brilliant pink, through all the grades of purple, to a lustrous blue.

The machinery in these works is of the most approved pattern. Mr. West had many years experience in ore-reducing in Europe, but he informs us that the Golden Works are the result of his experiments and investigations made upon the refractory ores of Colorado—his previous experience aiding him but little. He certainly deserves great praise for his patient study, and credit for the success that has attended it.

We learn from the *Transcript* that during the week succeeding our visit, these works turned out $5,000 worth of gold and silver bullion, and fifteen tons of clean lead were made ready for shipment. Superintendent West will locate works shortly in South Park, for the treatment of low-grade ores that will not pay for transportation to Golden.

What a Colorado Mine Has Done.

It is well known to every body in this part of the country that the Pelican mine is one of the best in the mountains, but of those who tacitly admit this there are doubtless many who are not aware of the extent of its richness and capacity.

For the information not only of home readers, but of many persons in the States to whom the *Miner* is a regular visitor, we will give a few figures, that are authentic and official, just to show what one mine is doing here. There are many persons in the States who do not yet believe that there is any profitable mining being done in Colorado. They are laboring under the delusion that for every dollar taken out of a mine a dollar is spent to get it; and while they admit the fact that the mines are producing largely, they think the production is not remunerative.

We do not wonder that many who have invested in wild-cat schemes and in experiments that were not successful, should be slow to believe that others have succeeded where they failed; yet such is the case, as the figures from many mines will show.

Some weeks since, we spoke of the discovery and present state of development of the Pelican; and we will now briefly allude to its yield of silver.

The balance sheet up to the first of the present month shows the gross product of ores from its various workings to have been $664,303, minus at an expense of $224,434, leaving a net profit of $439,869, to which must be added the amount now in the dump—at a low estimate $50,000, making a grand total of profits of $489,869.

These figures, large as they appear, do not, however, convey anything like a proper impression of the value of the mine at present. A very careful estimate of the ores now exposed and ready to be taken out has been made by Mr. Stoelting, Territorial Assayer, calculated upon the basis of the past product of the mine, as shown by the books, and from a careful computation of the number of fathoms ready to be taken down, after deducting twenty-five per cent. for barren ground. This estimate gives 3,300 fathoms of productive ground, that will yield a net profit of one million two hundred and sixty-four thousand six hundred and seventy dollars.

A splendid deposit has just been struck in an easterly drift, of which we will say more to-morrow.—*Colorado Miner.*

The New British Columbia Mines.

The following is a brief account of the new mines taken from the *Colonist*:

On May 1st gold was discovered by Henry Thibert, Xavier Loayon, and T. Talfair, on a creek now known as Thibert Creek. They got a few colors at first, but nineteen days afterwards, on the 20th of May, the ice broke up and they got $10 to a prospect. On the 23d of May they commenced work with rockers, and made from an ounce to $20 a day to the man in coarse gold. On the 1st of July they set steadily to work with rockers, and made ever afterwards from $11 to five ounces to the hand per day. The main diggings are on a bar of the creek. They also worked on the bench ten feet above high-water mark, the frost being still on the ground. On the bench they made from one to three ounces a day to the hand. The pay gravel is from six to twelve inches in thickness. They built a wingdam, and made from two to five ounces a day to the hand on the bar.

This creek is thirty to fifty feet in width. It runs from west to east, and empties into the Dease Lake, but where it heads is not known. It runs through a range of low hills, and the banks are well clothed with spruce timber, while fish abound in the lakes.

Dease Creek, fifteen miles to the south of Thibert's Creek, running in the same direction, and about the same size, was discovered by Moore & Co., who got good prospects of $10 to $22 to a pan. When these informants left, they were working on a bar with rockers, and making two and a half ounces a day to the hand.

Mr. Thibert has great confidence in the richness of the diggings. Their extent, of course, is not yet known. William Waldron is entitled to the honor of taking out the largest nugget yet found in the new diggings. He found a perfect beauty, weighing three and a half ounces, which is now in town. Mr. Thibert took but the next largest, weighing $22. In coming out, the party met three men from Nanaimo, half way between Buck's Bar and the diggings. They met six more men at Pack Saddle Creek, fifteen miles above Buck's Bar, and saw twenty-five men at Wrangle who had come up. Several miners from Omineca arrived yesterday.

Mr. Griffiths, of this city, from Lost Creek, brought $2,000. A miner who left the diggings three weeks ago came down by Frying Pan Pass. There was no snow on the creeks, and mining was going on as usual. On Lost Creek several claims were paying good wages. On Mansion several parties were also taking out gold. Jim May and party have gone to prospect the Bear Lake country at the headquarters of the Skena. The news of gold discoveries at Cassiar had reached Omineca, and men were leaving daily for the new gold fields.

Germany to Stop Coining Gold.

The Berlin *Borsen Zeitung* makes the important statement that the German Government proposes to stop coining gold for the present, after the existing stock of bars is used up, and to occupy itself exclusively with the coining of the new silver currency. It has been obvious for some time that the coining of silver as well as of gold would require to be undertaken; but this is the first authoritative statement that we have seen that the coinage of gold would be intermitted, even for a time. It may be useful to point out, however says, the London *Economist*, that some of the inferences which have been drawn in advance from this expected action of the German Government are not well founded. It is uncertain even yet when the intermission will begin, as the German Government is still a purchaser of gold in the London market, but assuming that no more purchases are now to be made, the market will not be wholly relieved from the influence of the German demands. The important fact is that the amount now coined, about $225,000,000, will be totally inadequate, according to all reasonable calculation, when the single gold standard is made compulsory throughout Germany, which will be in about two years' time, if not sooner. About 100 or 150 million dollars more will be required at the very least.

At some time or other, therefore, within the next two years, the German demand for bullion may be expected to revive, and the necessary effect will still be what it has been in the past, a perturbation of the money market and a constant tendency to protraction in business, consequent on the scarcity in the medium in which all contracts are expressed. The annual supply from the mines being about $100,000,000 and the annual consumption in wear and tear of coinage and the like about $60,000,000, the extraordinary German demand amounting to about $150,000,000 during the next two years cannot but cause some disturbance. It has been suggested that the present monetary convulsion in America will cause a return to specie payments in that country, and this would be the cause of another extraordinary demand, likely to strain the stock of bullion throughout the world during the next two years. We must not too readily conclude, therefore, that the temporary intermission of the German demand, satisfactory as it is for the moment in tiding us over a difficulty, is at all equivalent to the total cessation of that demand. The introduction of the gold coinage in Germany will be a cardinal fact in the money market for many months to come.

Sutro Tunnel.

Very few people, even professional men, says the *Enterprise*, are aware of the immense difficulties to be overcome in regard to projecting the line from the surface down to the bottom of the shaft, from whence it has to be continued both east and west in order to make an accurate connection of the several drifts on the line of the tunnel. The header, it will be remembered, was started from the month of the tunnel, in the town of Sutro, and is being pushed rapidly ahead in the direction of Mount Davidson. The drift is being run in a perfectly straight line, rising westerly with a grade of two inches to every 100 feet.

Shaft No. 1 is located 21 feet 9 inches off the center line in a northerly direction, and is distant from the mouth of the tunnel 4,885 ft. In order to start a drift from the bottom of shaft No. 1, to meet the header coming from the town of Sutro, it was found necessary to first run back 21 feet 9 inches in a southerly direction from the bottom of the shaft, until the center line of the tunnel was reached, thence to turn a right angle eastwardly, and run in this course until the header is met. In order to effect an exact connection between header and shaft extreme accuracy was necessary in surveying these lines. A serious embarrassment to correct surveying originated from the placing of a boiler on the surface just at the point where the line of the tunnel crosses the offset line of the shaft, so as to prevent placing the instrument over this very important point. It therefore became necessary to lay off the rectangular offset lines in front of the boiler past the shaft, thence to measure with offsets so as to get a parallel line over the top of the shaft, and from this parallel line to plum down to the bottom of the shaft, 523 feet 8 inches in depth, thence take this line at the bottom and prolong it southerly 21 feet 9 inches to the center line of the tunnel, and from this point turn a right angle and start east and west drifts. From the above mentioned statement it will be seen that the difficulties encountered in making the survey were much greater than those connected with the Hoosac Tunnel, the shaft of the latter being exactly on a line of the tunnel itself. The longest diameter of the Hoosac shaft is 27 feet and is placed in the line of the tunnel so that this line could be projected directly in the line of the tunnel and then be prolonged both ways. The longest base line that could be projected down the Sutro Tunnel shaft was six feet eight inches in length, provided that one plumb bob is hung down the pump shaft, while the other is hanging down in the hoist shaft, but the pump shaft is almost entirely filled with steam pipe, exhaust pipe, pump column and its braces, and a ladder way. Plumbing down the shaft was not considered reliable, as the wire might touch at some point or another; the shaft also being so hot from the exhaust steam as to prevent an inspection of the plumb-bob, therefore, the hoist shaft giving a base line of three feet, one inch in length, had to be depended upon for projecting the line of the tunnel down in the bottom of the shaft. The slightest variation made, even on the surface in this short base line, would result disastrously in throwing the east drift a long way off the true line.

Appreciating the difficulties previously enumerated, the Sutro Tunnel Company cast about for a civil engineer equal to the emergency, and eventually were fortunate enough to enlist in the enterprise Mr. H. Schussler, Chief Engineer of the Spring Valley Water Company, and still later of the Virginia and Gold Hill Water Company. Mr. Schussler entered upon the work with his usual energy and ardor. Under his careful and accurate surveying the drifts have been run straight as an arrow. He has been ably assisted by Ross E. Browne, a young engineer of marked ability. The driving of the tunnel is being prosecuted with the greatest vigor. Our reporter rode into the tunnel nearly a mile on a back-action car, an ill-natured mule being the propelling power. The two headers at present are only 102 feet apart, and the blasting and drill hammering can be distinctly heard in the respective faces.

A Colusa Mine.—The Colusa *Sun* of October 18th says: From all we can gather, this is perhaps the best quicksilver mine in the State. They have now a perfect mountain of ore in sight. Thousands of tons of ore have been laid bare with a few weeks work from three or four men. This ore averages as much perhaps as twenty per cent. pure silver. Chapin went below to-day to see about having a furnace put up. He is somewhat afraid he cannot get all the necessary material out there before the rain sets in, and he will order one or two retorts from the Marysville foundry to be sent out immediately. The other mines in the vicinity are also doing well. No capitalists have as yet taken hold of any of them.

Circular Saws.—An exchange says: Circular saws in America, except for timber cutting, are generally without guides to support them, and without packing boxes to keep the saw oiled and clear of gum. The result is that the saws have to be at least one-third thicker in order to be rigid enough for their work, consuming power, and wasting kerf in proportion. This needs thorough reform, and all benches where the top is not arranged to adjust for grooving should have guides and packing boxes.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and pateut right business, believing that the mutual conference of legitimate business and professional meu is mutual gaiu. Parties in douht in regard to their rights as assignees of pateuts, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

JACOB LITTLE.—Driving the main northwest tunnel is again being prosecuted with the utmost vigor night and day.

JUSTICE.—The ore-body in the north drift at the 300-foot level is opening out finely, and the extraction of ore has already commenced.

AMERICAN FLAT.—The west drift from the main southwest drift at the third station is being energetically driven ahead, the face within a very short distance of the point where it is expected that the ledge will be reached.

YELLOW JACKET.—The pump is steadily gaining on the water from the 1,500-foot level, and it is expected that the wator will be sufficiently drained to again commence work on that level by Monday next.

CHOLLAR-POTOSI.—Daily yield 140 tons of ore, which is worth $33 per ton, assay value.

CALEDONIA.—Enlarging the shaft for another compartment is not yet finished, hnt is making good progress.

OPHIR.—There is no change of value to report of the prospecting drifts at the 1,700-foot level.

SIERRA NEVADA.—Daily yield 60 tons of ore. The ore hreasts are looking and yielding finely as usual. Nothing new to report of the prospecting drifis.

OVERMAN.—Opening the new station at the 1,200-foot level of the shaft is making excellent progress.

JULIA.—The main southwest drift at the 900-foot level is making excellent progress, and is expected to reach the ledge in a very short time.

UTAH.—Opening the new station to drift for the ledge is making good progress.

IMPERIAL.—Sinking the incline is making fair progress, although the rock hlasts hard and tough.

SUTRO.—The main southwest drift at the 100-foot level of the new shaft is still driven ahead with excellent indications of the development of a hody of good ore.

BUCKEYE.—The yield of ore continues ahout the same, and there is little or no change in the qnality.

GOULD & CURRY.—Prospecting the lower levels of the mine continues as usual, with no change of interest to report.

PICTOU.—Work progressing as usual, with no change of importance to note.

SAVAGE.—There is no change of importance to note in the prospecting operations of the lower levels.

Dividend Paying Mines.

The Idaho mine of Grass Valley is a dividend paying mine. The San Francisco MINING AND SCIENTIFIC PRESS is a paper which professes to make a specialty of mining matters. It persistently leaves the Idaho mine out of its list of dividend paying mines. The Idaho declared its fifty-first dividend on the 6th of this month, and that dividend was for $62,000, or $20 to the share of capital stock. The MINING PRESS may have accidentally overlooked the Idaho's dividends, hut no such accidents should occur. —*Grass Valley Union.*

We heg to inform the *Union* that our list of dividend paying mines comprises only those mines which ar e regularly called on the Stock Board in this city. If the *Union* will take a moment to think it will readily see that it is utterly impossihle to ohtain a correct list of all the dividend paying mines of this Coast. By far the larger portion of onr mines are held hy private parties who are not compelled to puhlish any statement and who, therefore, do not take the trouhle to do so. In the eemi-annual and annual compilation of dividends, aseessments, etc., by the daily papers of the city, the commercial papers, stock journals, etc., no mines are mentioned save those whose offices are located in thie city, or whose names are on the lists of the Boards. The United States Mining Commiseioner, in his annual report totally ignores, in hie acconnt of dividends, any hut incorporated mines called on the Stock Boards. If it were possihle for ue to obtain any list of other mines which could he kept even approximately correct, we should be very glad of it, since many people hase their impressions entirely on the published etatements of dividends and assesements and the difference hetween them. We are eure to hear of the asseesments, for they must he advertiscd, hut when a really good mine is found, it is soon "gohhled" up hy the knowing ones, and they do not want to liat it on the Boards.

We have time and time again endeavored to imprese these facts upon casual obserers. We call the attention of the *Union* particularly to an article on this subject in our issue of May 10th, the present year, in which after summing up the amount of dividends paid hy companies the following paragraph occure:

It must he remembered, however, that these figures only represent the dividends of those mines dealt in at the Stock Boards, a point always to he horne in mind. Thousands of mines scattered over the Pacific Coast pay out large snms to their owners, of which the puhlio hear nothing. Some of our heavy mining capitalists town these mines alone or associated with one or two others, and as only private reports are made, the figuree are not made puhlic. We know of a numher of such instances. The hydraulic mines of our own State, owned hy a few hard working men, pay large sums monthly which do not find their way into the statistics. An example of this is shown in another column, where it will he seen that the Spring Valley Canal & Mining Company, of Cherokee Flat, Cal., turned out $50,000 in gold in April. Consequently people shonld not say: "Mining does not pay," hecause they see in the papers that during 1872 only $6,731,100 was paid out as dividends, while the bullion production was $62,236,914. This money not only went into husiness channels, hut supported many thousand men and made fortunes for thousands more.

We would also call the attention of the *Union* to the fact that we always mention the dividends of the Idaho, and with pleasure; hut always state that it is not a Stock Board mine. We mention in our issue of this week the fact that the Spring Valley Canal Company lately sent down $41,000 in gold, and still more recently sent down a har of gold worth upwards of $71,000, we do not know how much the mine pays in dividends, a great many mines like this and the Idaho heing worked hy private parties or corporations who do not want to sell any stock. They are therefore not noticed, as the California street Arahs cannot speculate in them. Whenever good first-class mines like the Idaho are found, the owners would rather hold on t o them themselves, than trust them in the douhtful and variahle form of stock on the Board. A great many of our heavy stock operators own such mines, hnt they never list them unless they hegin to peter out. They know too much for that.

We hope the *Union* will seo the force of our reasoning. If we put the Idaho on our list of mines, when it is never qnoted on the Boards, the statistics compiled at the end of the year will present great inaccuracies ae compared with those of other journals. Moreover it would not do to have hut one "outside" mine there, for we always strive to make our readers understand that onr list comprises only Stock Board mines and that hy far the majority of the good mines of the State are in comparative ohscurity as far as newspaper mention is concerned. We do not helieve in Stock miniug much ourselves and do not consider it a legitimate method of mining, and we are rather glad that such good mines as the Idaho and a few hundred others are free from the pernicions influence of California street operators.

Mining Suits.

A suit has heen commenced in the Fourth District Court in this city, hy John Perrault, against the Kossuth Mining Company, Joseph P. Cautin and Augustus F. Everett to secure certain interests in mining property. The complaint alleges that on January 15th, 1871, the plaintiff and H. Vallie were in possession of the Kossuth mine, in Devil's Gate District, Nevada. There was an outstanding claim against the mine, which they determined to purchase. To do this they proposed to form a company, and proposed that if Cantin & Everett should advance the necessary eum they should he entitled to one-third interest in the mine. The proposition waa accepted, and it was agreed that Perrault and Vallie should have each one-third. The title could he purchased for $5,000, and plaintiff urged its immediate purchase. But defendant urged that thie title was not neccssary, and that hy delay it could he purchaeed much cheaper. Plaintiff having occasion to go East, Cantin & Everett, learning of the real value of the mine, purchased the title for $3,500, and wrongfully obtained poseeseion of the mine hy repreeenting to Vallie that they would hold it for the henefit of the plaintiff. The Kossuth Company was then organized, with a capital stock of $1,350,000, and Cantin & Everett transferred the title to said Company, which it now holds. Since the return of Perrault from the East he has demanded hie one-third interest, equal to 9,000 shares, hut they refnsed to give it to him. He alleges that the stock is worth $10 per share. He praya judgment to compel the transfer of 9,000 shares, or in default thereof that the defendants, Cantin & Everett, pay him $90,000. He also asks for an order enjoining the defendants from selling or transferring the etock now held hy them.

Another suit of some interest is that hrought this week in the Twelfth District Court hy Joseph Mather against H. C. Kihhe, Joseph Marks, L. P. Drexler and T. F. Crouise, Secretary of the South Eureka Mining Company. The complaint alleges that the plaintiffs, Cronise and Ramage, were elected Trustees of the South Eureka Company in April, 1871. Plaintiff was chosen President and Cronise Secretary. Ramage resigned and S. Kilgore was elected in his stead as Trustee. Cronise and Kilgore tendered their resignations, hut they were not accepted. The plaintiff says that stockholders holding less than two-thirds of the capital stock obtained an order from H. L. Joachimsen, a Justice of the Peace, held an election and elected Kihhe, Marks and Drexler, Trustees. He claims that the order was absolntely null and void, and saye that the pretended Trustees have passed resolntions calling for payment of assessments, and Cronise, in accordance with instructions, has advertised certain stock for sale. He says that they have levied an assesment of 20 cents per share on the stock, which the plaintiff avers is nnnecessary, and levied in order that the Trustees can huy in the stock at a low rate and control the Company; and he charges that they are conspiring for this fraudulent purpose. Plaintiff asks for an injunction restraining the defendants from selling the stock, or exercising any of the powers of Trustees.

The Eureka Mine Report.

The Eureka mine, of Grass Valley, is one of our favorite California mines, and the annual report of the company makes an excellent showing of operations for the past year. The mine has paid out as dividends the sum of $260,000, and prodnced $486,854 worth of hullion. The report of the superintendent, Mr. Wm. Watt, states that up to the 30th of Septemher, during the fiscal year, they have driven 1,556 feet of drifts, 714 feet of cross-cuts, and they sunk 99 feet of winze.

They hoisted 7,820 tons of quartz, and crushed 7,852½ tons in 305 rnnning days as follows: Eighty-eight days with 15 stamps, and 217 days with 10 stamps, averaging 2¼ tons per day to each stamp.

They concentrated 86¾ tons of sulphurets, and worked 84¾ tons, and have now on hand 32 tons, which is valued at $3,500.

There are 247½ tons of qnartz on the surface, and 250 tons broke in the mine ready for hoisting.

The amount of quartz extracted during the past year from the various levels, has heen 7,820 tons, and there are upwards of 5,000 tons in sight which will pay well on an average.

The expense of extracting the ore is unusually large, owing to the inconvenience of getting to it, a large amount having to he handled twice, and the smallness of the ledge during the first half of the year; also the very hard nature of the ground reqniring the strongest hlasting agents to make any headway. The superintendent regrets not heing ahle to report a more favorahle result, hut hopes for better luck. Regarding the future prospects of the mine, he says; "I can form no decided opinion, as the solution of the question lies deeper than we have heen; although in the eighth level the walls are good and regnlar, and four feet apart, the ledge is small and very poor. The mill, hoisting and pumping machinery are all in gocd order." The Secretary's report gives the following statement of receipts and disbursementa:

RECEIPTS.

Cash account Oct. 1, 1872	$ 55,654.54
Bullion account	485,854.04
Construction account	95.00
Sulphuret reduction works	2,933.07
Milling account	413.50
Wood ranch	2,013.44

Sulphuret concentration	1,723.59
McDougal works	388.00
Wood ranch	2,009.75
General expenses	5,261.84
Bullion expenses	1,812.42
Discount account	53.65
Cash account Sept. 30, 1873	113,556.25
	$570,503.84

The assets of the company eqnal $207,260.72, and there are no liahilities. In the assets the mill is valued at $40,000; improvements, $30,000. The cost of mining 7,780 tons of ore for the ycar was $100,046.50; the cost of milling 7,852½ tons of ore for the same time was $21,226.03. The average cost of mining was $12.71 per ton; the average coat of milling was $2.70 per ton, During the year 127½ tons of sulphurets were concentrated at a cost of $19.87 per ton, and reduced at an average of $23 per ton. Average yield, $80.57 per ton.

Since the company first hegan operatione, Oct. 1et, 1865, up to Sept. 30th, 1873, it has extracted $4,071,547.89 in hullion, and other receipts added up the total receipts to $4,099,473.21. Of this they paid out for sundry titles $301,906.50; for construction, $141,844.71; to dividends, $1,974,000; to rnnning milling and other expenses, $3,974,035.71. The officers for the past year were as follows: George W. Beaver, President; William Watt, Superintendent; Francis Berton, Treasurer; R. Wegener, Secretary. The Trustees were G. W. Beaver, Wm. Watt, R. F. Morrow, L. S. Adams and S. B. Sherwood.

PLUMAS COUNTY farmers are digging a canal to protect their ranches from the overflow of tailings from the mines on Spanish creek and the small streams which empty into it above the American valley.

Asiatic Cholera in China.

ALMOST EVERY CASE CURED WITH

PAIN-KILLER!

DEAR SIRS: During a residence of some ten years in Siam and China, as a missionary, I found your Pain-Killer a most valuable remedy for that fearful scourge, the Cholera.

In administering the medicine, I fonnd it most effectual to give a teaspoonful of Pain-Killer in a gill of hot water sweetened with sugar; then, after about fifteen minutes, begin to give ahout a tablespoonful of the same mixture every few minutes until relief was ohtained. Apply hot applications to the extremities. Bathe the stomach with the Pain-Killer, clear, and rub the limhs briskly. Of those who had the Cholera, and took the medicine faithfully, in the way stated above, eight out of ten recovered.

REV. R. TELFORD, Missionary in China.

DEAR SIRS: During a long residence in China I have nsed your valuable Pain-Killer, both in my own family and among the Chinese, and have found it a most excellent medicine. In the summers of 1862 and 1863, while residing in Shanghai, I found it an almost certain cure for cholera, if used in time. Indeed, using it in a great many instances, I do not remember failing in a single ease. For three years I have been residing in this place, more than fifty miles from a physician, and have heen obliged often to fall upon my own resources in cases of sickness. The Chinese come to us in great numbers for medicine and advice. Though without medical knowledge ourselves, the few simple remedies we can commend are so much in advance even of their physicians, that we have almost daily applications. We allow them to come, because it hrings us in contact with them and opens a door of usefulness. In diarrhea, colic, vomiting, cholera, coughs, etc., your Pain-Killer has been my chief medicine. Yours, very truly,

REV. T. P. CRAWFORD, Tungchow, China.

Those using Pain-Killer should strictly observe the following directions:

At the commencement of the disease, take a teaspoonful of Pain-Killer, in sugar and water, and then hathe freely across the stomach and bowels with the Pain-Killer clear. Should the diarrhea and cramp continue, repeat the dose every fifteen minutes. In this way the dreadful scourge may he checked and the patient relieved in the course of a few hours.

N. B.—Be sure and get the genuine srticle; and it is recommended by those who have nscd the Pain-Killer for the cholera, that in extreme cases the patient take two (or more) teaspoonfuls instead of one.

The PAIN-KILLER is sold hy all the Druggists and Dealers in Family Medicines.

☞ Price, 25 and 50 cents and $1.

PERRY DAVIS & SON,
Manufacturers and Proprietors, 136 High street,
oc11 Providence, R. I.

MR. L. P. MCCARTY, corresponding agent of the MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, JOURNAL OF COMMERCE and ILLUSTRATED PRESS, paid us a visit this morning. The SCIENTIFIC PRESS is well known to our people as a reliable vehicle of mining information, and Mr. M.'s "Notes of Travel" are also familiar to them. Mr. McCarty will examine our leading mines and will go hence to Belmont, visiting Galena and Battle Mountain on his way homo.—[Reese River Re eille, Sept. 12th.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the hinder (which is very durahle) nsed continuonsly for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. 1amhp

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illnetrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventore and patentees: list of Goverment fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

ASSIST NATURE IN HER EFFONTS to shake off a congh or cold, or she may revenge herself hy giving up the contest. Remember that with *Hale's Honey of Horehound and Tar* for an ally, she will extinguish the worst cough in a few days. Crittenden's, 7 5th Avenue. Sold by all Druggists.

Piko's Toothache Drops cure in 1 minute. *

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE Co. J. B Roherts, 315 California Street, San Francieco, is general agent for thie Coast. Send to him for circulars and information of this reliable, first-class company.

CONTINENTAL LIFE INSURANCE Co., No. 302 Montgomery street, corner of Pine, San Francisco. *

SHAREHOLDERS,

TRUSTEES, and

SECRETARIES of

ALL MINING COMPANIES,

Should see to it that their Notices are advertised legally in the MINING AND SCIENTIFIC PRESS, at much less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Bunker Hill Quartz Mining Company.—

Location of works, Amador, Amador county, Cal. Location of principal place of business, 19 First street, San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 11) lavied on the 10th day of September, 1873, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Wales L. Palmer	113	20	$200 00
Wales L Palmer..	120	20	200 00
Wales L Palmer	121	20	200 00
Wales L Palmer	122	20	200 00
Wales L Palmer	124	20	200 00
Wales L Palmar	125	20	200 00

And in accordance with law, and an order of the Board of Directors, made on the 10th day of September, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 19 First street, San Francisco, Cal., on Monday, the third day of November, 1873, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WALES L. PALMER, Secretary.

Office, No. 19 First street, San Francisco, Cal. oc18

Buena Vista Petroleum Company.—Location

of principal place of business, San Francisco, State of California. Location of works: Buena Vista, Kern county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of September, 1873, an assessment (No. 1) of one dollar per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 430 Jackson street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 7th day of Novemhar, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on tha 25th day of November, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

L. AGUAYO, Secretary.

Office, No. 430 Jackson street, up stairs, San Francisco, California. se27

Black Mountain Coal Mining Company—

Principal place of business, City and County of San Francisco, State of California. Location of works, Santa Cruz County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of October, 1873, an assessment of Two and one-half Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, at the office, No. 402 Montgomery street, Room No. 23, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the first day of December, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 29th day of December, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. H. PARSHLEY, Secretary.

Office, No. 402 Montgomery street, Room No. 23, San Francisco, Cal. no1

Cupel and Tiger Silver Mining Company

—Principal place of business, San Francisco, California. Location of works, Wallapai Mining District, Mobave County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directars of the above named Company, held on the 25th day of Octoher, 1873, an assessment af Twenty Cents per share was levied upon the capital stack of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room No. 12, Express Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Wednesday, the 26th day of November, 1873, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on Satnrday, tha 20th day of December, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, Room 12, Express Building, San Francisco, Cal. San Francisco, October 25, 1873.

Commercial Coal Mining Company of

San Francisco. Principal place of business, City and County of San Francisco, State of California. Location of works, Santa Cruz County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of October, 1873, an assessment of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at his office, No. 402 Montgomery street, room No. 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of November, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the fifteenth day of December, 1873, to pay the delinquent assesement together with costs of advertising and expenses of sale.

S. B. HANSON, Secretary.

Office—No. 402 Montgomery street, room No. 23, San Francisco, California. oc18

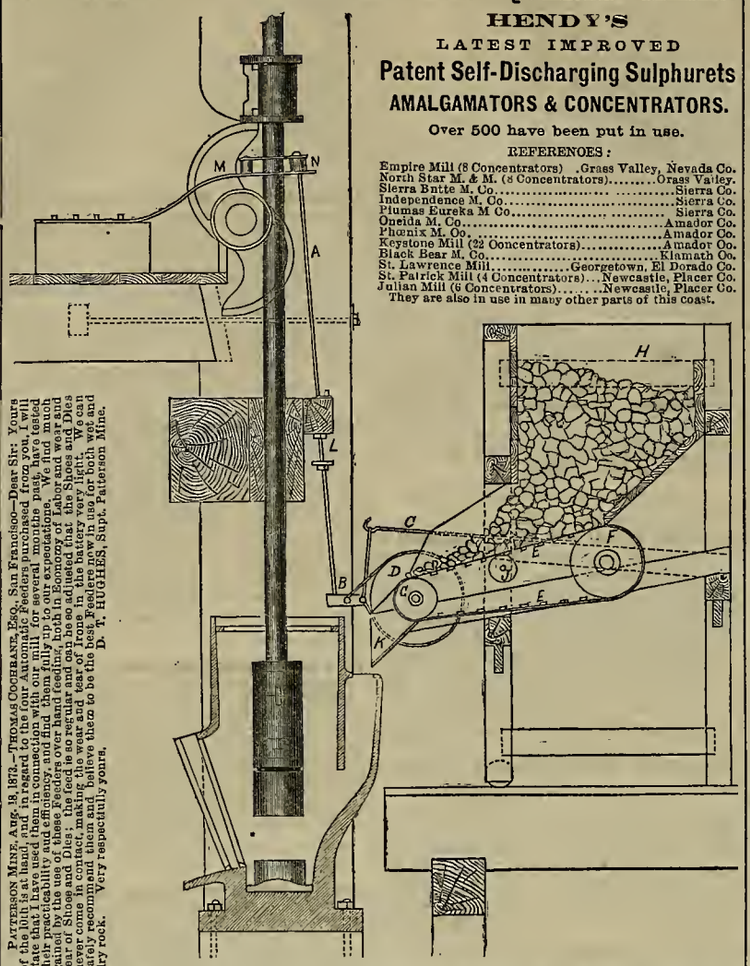
COCHRANE'S ORE FEEDER FOR QUARTZ MILLS.



PATTERSON MINE, Aug. 19, 1873.—THOMAS COCHRANE, Esq., San Francisco—Dear Sir: Yours of 18th inst. to hand. In reply would say that we have had your Ore Feeder in use for several months past, and have tested their practicability and efficiency, and find them fully up to our expectations. We find much state that I have used them in connection with our mill for several months past, have tested gained by the use of these Feeders over hand feeding, both in economy of Labor and wear and tear of Shoes and Dies; the feed is so regular and can be so adjusted that the Shoes and Dies last double the time they do when fed by hand. We take pleasure in saying that we can safely recommend them and believe them to be the best Feeders now in use for both wet and dry rock. Very respectfully yours, D. T. HUGHES, Supt. Patterson Mine.

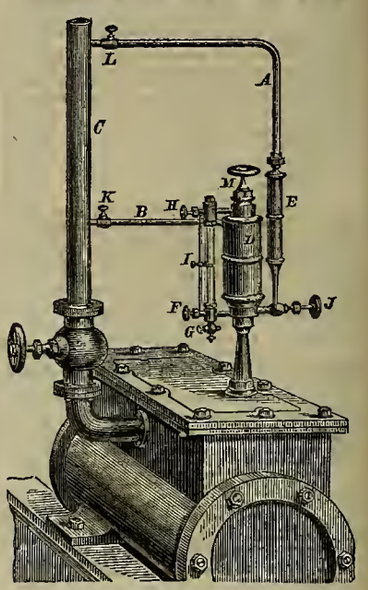
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pips O; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented Febrnery 14, 1871. Mannfactured by California Brass Works, 125 First street, S. F. 24v23tf

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.

Dutch Flat, Augnst 1, 1873. 6v27-2m

PURCHASERS please say advertised in Scientific Press.

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 200 blows per minute, in a mortar provided with screens on both sides, and crushes FIVE TONS lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $400.

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

THEODORE KALLENBERG,

MACHINIST,

and Maker of Models for Inventors. All kinds of Dies Stamps and Punches made. Also, all kinds of Small Gears Cut.

Repairing done on very Reasonable Terms and in the best manner. No. 32 Fremont street, S. F. 19v23-3m

STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices at

10v27tf No. 32 FREMONT STREET.

AXLE GREASE.

To Miners, Millmen and Others.

TRADE MARK H&L AVOID IMITATIONS

Your attention is called to the very superior AXLE GREASE manufactured by us for over 18 years.

Recent improvements in the chemical arrangement of the lubricants used in its manufacture render its use as serviceable on the lightest buggy as on the heaviest team.

The extensive demand for the H. & L. Axle Grease has enabled the proprietors to reduce its price to as low a rate as any of the inferior compounds, which are continually being forced upon the market.

See that the trade-mark (H. & L.) is on the red cover of the package, and take no other.

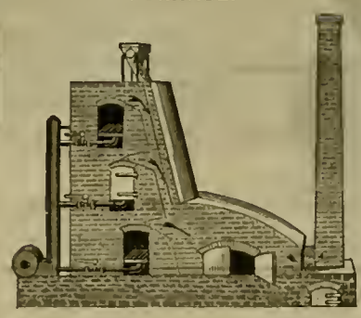
Metallurgy and Ores.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

THOS. McGLEW & CO.

INSURANCE is obtained at our mill at LESS RATES than any other in the city.

P. O. Box 2028. GEO. D. WYMAN,
5v27-3m Superintendent.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Nevada Metallurgical Works,

21 First street.....San Francisco.

Ores worked by any process,
Ores sampled.
Assaying in all its branches.
Analysis of Ores, Minerals, Waters, etc.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Roehling .....East River Bridge Company, N. Y.

For further information, etc., address

L. C. PARKE,
VIRGINIA CITY, NEVADA.
AGENT FOR THE PACIFIC COAST. f15

San Francisco Metal Market.

WEDNESDAY, M., Oct. 29, 1873.

Iron for building purposes is meeting good sale here, on account of the large number of buildings now going up, in which Iron is an important element of construction. Our foundries and machine shops are also well employed, and this creates a demand for crude metals, which is always constent, but now quite pressing.

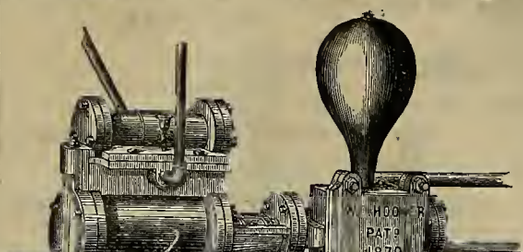
Hooker's Patent Direct Acting Steam Pump.



SIMPLE, CHEAP AND DURABLE.

Adapted for all purposes for which Steam Pumps are used. Manufactured by the inventor and patentee, at *Hooker's Machine Works, No. 13 Fremont st., San Francisco*

☞ SEND FOR CIROULAR.

N. B.—Also manufacturer of Hooker's Deep Well and Double-Acting Force Pump. Received the Silver Medal awarded at the last Mechanics' Fair in San Francisco. 18v27-2am3m

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,
General Agents, No. 210 Front Street.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Sunerintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgist's Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by DEWEY & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

NOTICE TO BUILDERS.

SEALED PROPOSALS, for furnishing certain materials and constructing a portion of the Napa State Asylum Building for the Insane, will be received at the office of the President of the Board, No. 204 Sutter street, San Francisco, until 12 o'clock M. of the 30th day of October, 1873.

The printed specifications and printed forms of proposals can be had on application to Messrs. Wright & Sanders, Architects, 418 California street, where plans and drawings can be seen and all further information obtained. No bids will be entertained unless made on the specified printed forms of proposals and accompanied with a certified check or bond with two or more good and sufficient sureties, in a sum equal to ten per cent. of the total sum of the tender, to be returned on the due entering into the contract by the party to whom it may be awarded, or to be forfeited if the party fails to enter into the said contract.

The Board reserves the right to reject any or all bids.

oc4-td J. F. MORSE, President of the Board.

The time for receiving the above tenders is extended until 12 o'clock M. on THURSDAY, November 20th next.

J. F. MORSE, President.

NOTICE.

To Plumbers, Tinnsre, Metal Roofers, Typs Foundsrs, Iron Foundsrs, Etc.

F. O. BELDEN & CO., METALLURGISTS, are now manufacturing at their works, No. 216 FIRST STREET, SAN FRANCISCO, a superior quality of

Solder Babbit Metal and Type Metal,

Which they can supply, in quantities to suit, at a MUCH LOWER PRICE than any wholesale house in this city.

At the lowest Market Prices

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon ore mine in Freihurg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.,—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 6, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,200 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 660 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe, As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

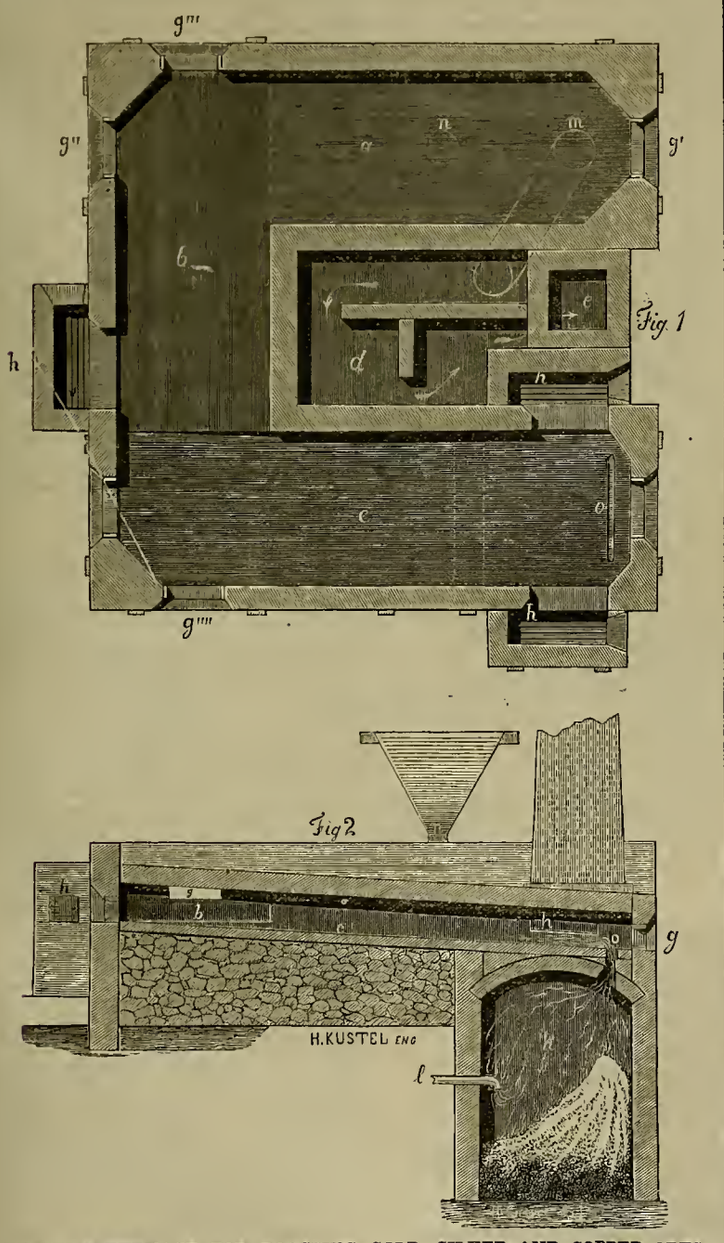
SAN FRANCISCO, SATURDAY, NOVEMBER 8, 1873.

VOLUME XXVII Number 19.

Kustel's Improved Reverberatory Furnace.

Some years ago the introduction of the long roasting furnaces was cousidered a great improvement on the old style, single hearth furnaces, but, though less fuel and labor were required to perform the roasting, it was still a tiresome business. The most laborious part of the work was the lateral pushing of the ore for sixty or eighty feet towards the discharge hole. Another detriment was the comparative length of time required to finish a proper chlorination; but the fact that the roaster has it completely in his power to obtain a final satisfactory result, no matter how difficult the ores may be to treat, keeps the long furnace still in use in preference to all others in Mexico, where labor is cheap.

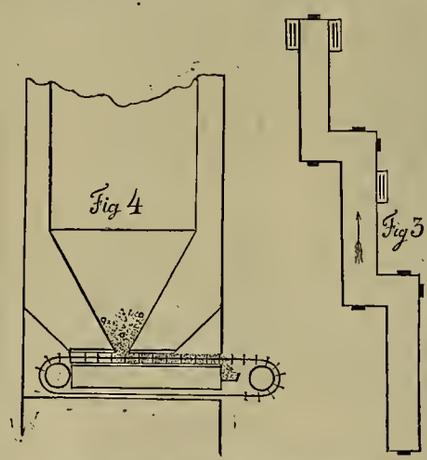
A short time since, Mr. Guido Kustel, who is well known in mining circles on this coast, obtained a patent through the SCIENTIFIC PRESS Agency for an improved reverberatory furnace for roasting gold, silver and copper ores, which is designed to entirely overcome the defects alluded to in this class of furnaces. Fig. 1, of the accompanying engravings, shows a horizontal section of Mr. Kustel's new furnace, and Fig. 2 is a vertical view of the same. The first part of the improvement consists in the adaptation of the broken straight line of the long furnaces so that no hearth is longer than 20 feet, and may be easily reached from the doors, *g*, *g*, by means of hoes. The ore is charged through the funnel, *n*, on the hearth, *a*, which is level, and is spread with a hoe. After an hour's time, the ore is drawn at *g‴* and pushed from *g'* till all of it is on the inclined hearth, *b*, from which it is moved to *c*, and discharged through the opening, *o*. There are three fire-places, *h*, *h*, to keep up the required temperature in the furnace. The gases and fumes pass through the flue, *m*, in the roof, into the dust chamber, *d*, and from there into the chimney, *e*, which may be also outside the building if preferred.



KUSTEL'S FURNACE FOR ROASTING GOLD, SILVER AND COPPER ORES.

This method of having the doors only at the ends of the long sides, facilitates the work of the roaster, there being no tiresome side-work and stirring required, unless a very obstinate ore should be treated. The moving of the ore from one end of the furnace to the other does away with the stirring.

Another very important improvement will be found in the chloridizing chamber, *K*, Fig. 2, into which the ore is drawn through the opening, o, in a red hot state. In this condition the ore may be kept there as long as appears necessary to finish the chlorination of the silver. While this process is going on all the chlorine and volatile metallic chlorides evolved from the mass of ore draw through the narrow opening into the furnace and operate as a chloridizer on the silver ore with which it is in direct contact through the whole length of the furnace. In case the ore, treated is entirely free from sulphur, the chamber may serve as a generator of sulphuric acid for the purpose of setting free the chlorine of the salt, by admitting sulphurous gas through the pipe, *l*, obtained by simply burning brimstone.



METHOD OF DISCHARGE OF ORE.

With the aid of the chamber, from 15 to 20 tons of ore can be roasted in 24 hours, employing two shifts of three men each, and consuming less than one-fifth of one cord of wood per ton. Having the roasting perfectly under control, the highest percentage of chlorination is obtained.

The patent obtained by Mr. Kustel includes not only the shape of the furnace, as represented by Figures 1 and 2, but the broken line of the long hearth generally, by which the lateral forward moving of the ore is avoided. The local arrangements of a mill may be better suited by the form of furnace as represented in Fig. 3. In these furnaces the hand work is easily substituted by an approved mechanical arrangement, with continuous charge and discharge, fed directly from the battery. This makes the furnace more expensive, but it may nevertheless appear very advantageous under certain circumstances.

The discharge of the chamber, *K*, can be also made continuous, or at intervals, keeping the ore in the chamber at a certain level permamently, as shown by Fig. 4, by means of an endless chain. A few holes in the wall would serve as a place to loosen the ore by means of an iron rod, in case any "choking" should take place. If any of our mining friends should desire further information concerning this furnace they may obtain it by addressing Mr. Kustel at 631 Clay street, in this city.

RICH GOLD DISCOVERIES are reported on the Rio Grande, and several parties are preparing to leave Salt Lake City for that region.

News from the Arctic.

News from the whaling fleet in the Arctic on this side this year, under date of August 16, states that the weather has been unusually mild and free from storms. The ocean was quite free from ice in the vicinity of Wrangell's Land and Point Barrow. Capt. Owen, of the "Jirch Perry," writes to the Honoluln *Advertiser* that it has been an open season—in fact too much so. He has been to longitude 151° to the eastward of Point Barrow and has no douht but that a steamer could have gone to the MacKenzie River and, he says: "I dou't know but clear through the northwest passage."

Capt. T. W. Williams, who has returned from the Arctic and who has donated a collectiou of natural history specimens to the California Academy of Sciences, corrohorates these statements. He says that the season has been a very "open" one and unfavorable for collecting, as he was unable to obtain a single whale. He went as high as 72° 15′ and could have gone much further. He says several of the whalers were as far east as Smith's Bay, or 153° east, and could have gone much further had they not been afraid of the ice coming down and cutting off their retreat.

Capt. W. H. Dall of the U. S. Coast Survey and who has been up north in tho U. S. Coast Survey schooner "Yukon" writes a private letter to a gentleman in this city, which contains some interesting statements. He writes from Iliuliuk, Unalashka, under date of September 22nd. Mr. Dall has been very successful in the hydrographic work of the Coast Survey. All his work has prospered, including the collections, and the results are satisfactory, though the reverse of what they all expected. There is hardly a trace of Asiatic influence in *fauna* or *flora* which grow more meager and more Arctic, not to say Continental, the further they went westward. He says: "Of course I have some new and many interesting things, hut no warm water birds. I have, however, full material for working up the distribution, which is rendered all the more simple by the unexpected characteristics now discovered. I have interesting discoveries in prehistorics and altogether the work has succeeded well. The party have been more than usually harmonious. All enjoyed good health and spirits, if not good weather. The vessel has covered herself with laurels." Mr. Dall was to sail the day after this letter was written, for the Sbumagin Islands, going thence to Kadiak, and then set sail for this city, where he expects to arrive early this month.

It will be seen from this Mr. Dall has made some quite interesting discoveries. We would expect to find more of western form in the western Islands of the Aleutian chain, and it was anticipated that Asiatic forms, both as regards manner of life and the vegetation of the islands, would predominate. This seems not to have been the case, and Mr. Dall's report will be looked for with interest. He is not only working for the Coast Survey, hut it will he remembered that he has a distinct appropriation from Congress and is also collecting for the Smithsonian Institution. He does not, however, forget the California Academy in his researches. In view of the fact that there has been an unusually open season, it is to he regroted that the season could not have been utilized in the interest of science for exploration in the "Far North." If there had been any measure taken by which a party had been ready for such occasions, they might have settled some questions which it will take years of hard work to solve. A steamer this year might have made her way directly to that point which has been sought for so long.

No county in the State has a larger area of rich gravel deposits than Nevada, and there are many claims within a few miles of Nevada City.

Engineering at the Sutro Tunnel.

A few weeks ago we had the plsasurs of examining the great work of the Sutro Tuunel, and alluded to the difficulties encountersd by the Civil Engineer Departmeut in effecting en accurete connection betwesn the eest and west drifts. In order to refresh ths memory of our rsaders as to ths nature of those difficulties, we ars obligsd to recapitulate briefly:

"Tbe headsr, it will be remsmbered, was started from the mouth of the tunnsl, in the town of Sutro, and is being pushed rapidly ahead in the direction of Mt. Davidson. The drift is being run in a perfsctly straight lins, rising westerly with a grade of two inches to every 100 feet.

Shaft No. 1 is located 21 feet 9 inches off the center line in a northerly direction, and is distant from the mouth of the tunnel 4,885 feet. In order to start a drift from the bottom of shaft No. 1, to meet the header coming from the town of Sutro, it was found necessary to first run beck 21 feet 9 inchee in a southerly direction from the bottom of the shaft, until the center line of the tnunel was reached; thence to turu a right angle eastwardly, and run iu thie course until the header is met. In order to effect an exact counection between header and shaft, extreme accuracy was necessary in eurveying these lines. A serious embarrassment to correct surveying originated from the placiug of a hoiler on the surface just at the point where the line of the tunnel crosses the offset line of the shaft, so as to prevent placing the insbrument over this very important poiut. It therefore became necessary to lay off the rectanguler offset lines in front of the boiler pest the shaft, thence to measure with offeets so as to get a parallel line over the top of the shaft, and from this parallel line to plumh down to the bottom of the shaft, 523 feet 8 inches in depth, thence take this line at the bottom and prolong it southerly 21 feet and 9 inches to the center line of the tuunel, and from this point turn a right angle and start the east and weet drifts. From the ahove mentioned statement it will be seen that the difficulties encountered in making the survey were much greater than those connected witb the Hoosac Tunnel, the ehaft of the latter heing exactly on the line of the tunnel itself. The longest diameter of the Hoosac shaft is 27 feet, and is placed in the line of the tunnel so that tbis line could be projected directly in the line of the tunnel and then be prolonged both ways. The longest base line that could be projected down the Sutro Tunnel shaft was eix feet eight inches in length, provided that one plumh-bob is hung down the shaft, while the other is hanging down in the hoist shaft; but the pump ehaft is almost entirely filled with the steam pipe, exhaust pipe, pump column and its braces, and a ladder way. Plumbing down the shaft was not conciidered reliable, as the wire might touch at some point or another; the shaft also heing so hot from the exhaust steam as to prevent an inepection of the plum-bob, therefore, the hoiet ehaft giving a base line of three feet, one inch in length, had to be depended upon for projecting the line of the tunnel down in the bottom of the shaft. The slightest variation made, even on the surface in this short base line, would result disastrouely in throwing tbe east drift a long way off the true line.

Appreciating the difficultiee previously enumerated, the Sutro Tunnel Company cast about for a civil engineer equal to the emergency, and eventually were fortunate enough to enlist in the enterprise Mr. H. Schussler, Chief Engineer of the Spring Valley Water Company, and still later of the Virgiuia and Gold Hill Water Compeny. Mr. Schussler entered upon his work with hie usual energy and ardor. Under his careful and accurate surveying the dr.fts have been run streight as an arrow."

We are able to state that all tbe difficulties referred to in the foregoing article, are overcome, and the connection which has been eo much talked of in professioual circles, is *un fait accompli*. Aud right here we may state that even tbe most skilled civil engineers, well acquainted with the subject, decmed a difference in the connection of from two to five feet, a very close hit. As we previously predicted, Mr. Schussler wes equal to the task.

At 10 minutes of 11 o'clock A. M. ou the 27th of October, the two drifts met. In the afternoon of the same day, Mr. Joseph Aron, President, and Mr. Hooper, Director, who were present at the time the connection wae made, forwarded a message to Mr. Adolph Sutro, London, of the following wording:

"SUTRO, October 27, 1873.
Schussler connected tunnel to-day. Grade within ½ inch; center line, ¾ inch.
(Signed) JOSEPH ARON."

On the Saturday previous a dispatcb was seut to the President in San Francisco, to leave there for Virginia on Sunday morning, and thus this gentleman with a party of others interested in the enterprise, arrived at the Tunnel just in time to witness the great event.

Eerly in the morning on Monday Mr. Schuseler sent his old chain-man, John Higgins (who hae followcd his footsteps for ten years and helped to make five tunnel connections during that time), over to shaft No. 1 to measure the progress made since Saturday morning. He came back in breathless haste aud reported that the rock had during the last forty-eight hours turned softer, and that a progrces of about four feet more than was anticipated had been made. Upon hearing this unexpected but favorable news, Mr. Schussler exclaimed excitedly, "Tbsy are witbin thrse feet of one another." He called young Ross Browne, his essistant, and both rushed into ths tuunel up to the face of ths header. Fiftesn minutes after their arrival, a cartridgs of gient powder being placed in a drill hols in the center of the fecs aud ignitsd, blsw a hole about ten inches squers through the remeining barrier of rocl..

The excitsment ceused by this event was intense and the shifts of miners and foremen who were gathsred in the respective faces, gave vent to their joy in an uuearthly ysll that made the old mountain ring, at the sams time Schussler, Browne, and Jacksou, the foreman, rushed forward and shook hands through the opening, with Bob De Noon, ths Mining Superintendent of ths company, Mr. Brew, foreman at Shaft No. 1, and all the boys on the sbift. Enough rock was theu knocked off with a pick to eularge the aperture sufficiently to allow the men to crawl througb from one drift to the other. As a matter of course a drink was had all around. Tbe draught through the opening at the time was almoet strong enough to force a man through it into the opposite drift. At this junctnre tbe President, Mr. Aron, Mr. Hooper and Mr. Clark, who bad just arrived from San Francisco, together with Mrs. Sutro, Mr. Safford and Mr. Pitchford, arrived on the epot, and by the aid of sturdy miners were lauuched through the aperture. Mr. Schussler received witb commendable modesty the warm congratulations of the party upon tbe success of the undertaking, and requeeted them to delay a few moments to witness any discrepanciee whicb might have occurred in his survey. The instruments were placed in position and fore and back sights taken through the opening, and to the great astouishment of everybody, the difference in his eurvey between the opposite drifts amounted to only one-half inch in the level and seven-eigbts of an inch in the liue! This result, although hardly credible, judging from the difficulties he had to contend with in making his eurveys, is a truly wouderful triumph in the line of underground surveying, and adds fresh laurels to the brow of the champion civil engineer of America.

At tbe date of this writing the barrier of rock has been entirely cut away, the track put in position, so that all traces of the point of counection are gone.—*Gold Hill News.*

Chemicals in Pan Amalgamation.

[Continued from page 274.]

The following table will show results obtaiued in workiug on a large scale two different lots of slime:

1. Slimes from various mills.
2. Slime from Savage ore.

RESULTS OBTAINED IN WORKING SLIMES.

Numbor.	Assay value per ton.			Yield per ton.			Per cent. extracted.			Fineness of bullion.		
	Gold.	Silver.	Total.	Gold	Silver.	Total.	Gold.	Silver.	Total.	Gold.	Silver.	Total.
1	$7.28	$28.44	$35.72	$4.01	$20.20	$24.21	55.08	90.01	81.46	005	401	406
2	6.03	35.70	41.73	4.60	31.08	35.68	76.28	87.06	85.50	005	537	542

The results obtained in the working of lot No. 2 are somewhat above the average, which can be estimated at about 80 per cent. of the assay value.

Tbe method of treatment now in vogue is susceptible of modification and improvement. The yield can be increased by charging the chemicals at two different periods, say two-thirds at first and the remaining third two or three hours later. This ie due to the fact that the action of the chloride of copper becomes more feeble as time elapses, and is revivified by the addition of this second portion.

A saving in the amount of salt consumed can be effected by dissolving it together with the sulphate of copper in vats in proportions approximating to their chemical equivalents, and charging the resulting chloride of copper in the liquid state. The plan of putting the sulphate of copper and salt into the pan separately, necessitates a large excess of the latter to insure the complete decomposition of the former. An excess of salt wae originally deemed advantageous on the supposition that it would act beneficially in holding ths chloride of silver in solution, thus prssenting mors surfaces of contact to the action of the quicksilvsr, and, moreover, would convert the Hg Cl formed to Hg Cl^2, in which stats it would bs precipiteted by ths iron of the pans in the metallic form. It is, howevsr, improbable that such re-actions should occur on a largs scele where ths rs-agents represent so small a proportion of the entire mass.

The discovery of a cheap method of working slimes led to important results. The sams process was soon applied to the working of low-grade tailings, of which vast quantitiss had accumulated on ths plains hordering on the Carson River, at Dayton, and at othsr points. Several mills, witb a capacity of working from 250 to 300 tons psr diem each, are now in operation in Dayton and vicinity. The tailings which were formerly allowed to run into the Carson River, are now carefnlly eaved, and in fact to such an extent has the re-action set in against tbe wasteful prac ices of the past, that many mill-owners save the tailings after they have passed through the pans, with a view to reworking them at some future time. The teilings being mostly very poor, it bscomes necessary to work a large amount daily in order to obtain a fair interest on the capital invested. Thie is effected by using very large pans and by rapid amalgamation. Economy in the time devoted to amalgamation cannot, however, be effected without sacrificing a portiou of the precious metals which might otherwise be eaved. It is, however, considered policy to suffer this loss. The method of treatment is practically the eame as in working slimes, with the exception that a smaller proportion of sulphate of copper and salt is ueed, and that in other respects lese attention is paid to the extractiou of a high percentage, the value of the tailings not justifying too careful a manipulation. For the same reason the extra expense of grinding the tailings, which would undoubtedly iucrease the yield, is dispensed with.

As a rule tbe bullion produced is very base, not exceeding on the averags .450, and often going as low as .350.

In the mill of Birdsall & Co., in Dayton, where the crnde hullion rarely exceeds in fineness the latter figure, aninexpensive process has been adopted for partially refining it.

As bullion comes from the retort a great portion of the copper is found in a crust ou the surface of the elab. This slab-crust, whicb contaius some silver and gold, ie eeparated from tbe finer metal heneath, and the latter ie cast into bars 500 to 600 fine. Tbc cupreous crust is roasted in a reverberatory furnace and crushed, and the copper-oxide separated by means of eulphuric acid. The bullion from other mills is sold in the crude etete, and euffers a discount proportiouate to its baseness.

Even with the use of sulpbate of copper aud salt, the percentage extracted from low-grade tailings rarely exceeds 50 to 55 per cent. This is due principally, as above stated, to the necessity of a cheap, rapid, and consequently imperfect treatment. The eame tailings, however, worked without chemicals, but otberwise in the same manner, would not yield over 20 to 25 per cent. of their value, and in some cases not so much as that. Richer tailings give hetter results, aud are aleo treated more carefully.

In a mill of large capecity, and in good working order, the cost of working does not exceed $3 to $4 per ton. Hence tbere is still a margin for profit on tailings assaying only $9 to $10 per ton.

The pans now almost universally in use in the Washoe tailing-mills have a capacity from 6 to 8 tons, and the time of working the charge geuerally does not exceed four hours. More than half an hour, however, is consumed in charging and discharging, in heating the pulps, etc. The actual time of treatment, therefore, is lese than three and a half bonre.

The following table will show the amount extracted from one half hour, to one half hour, from a charge of tailings assaying $15.31 per ton, worked in a pan of eight tous' capacity.

Value of tailings, $15.31.

	Yield per Ton Silver.	
Assay value of sample from pan, end of first half hour	$12.40	2.91
Assay value of sample from pan, end of second half hour	11.70	.70
Assay value of sample from pan, end of third half hour	10.83	.87
Assay value of sample from pan, end of fourth half hour	9.58	1.25
Assay value of sample from pan, end of fifth half hour	9.02	.56
Assay value of sample from pan, end of sixth half hour	8.09	.93
Assay value of sample from pan, end of seventh half hour	7.85	.24
Assay value of sample from pan, end of eighth half hour	7.77	.08
		7.54

Total percentage extracted, 49.30 per cent.

The falling off in tbe yield in the seventh and eighth half hours is due to the insufficiency of chemicals used, their action having spent itself in the earliest part of the treatment.

Until the introduction of the use of sulphate of copper and salt, the working of tailings was confined to rich lots, where a small percentage of the value would still prove remunerative, and to blanket-coucentrations. The richness of the latter consisted to a great extent in amalgam, and its successful extractiou was consequently an easy matter.

[Concluded next week.]

TOBACCO leavee for cigar wrappers are now dried over chloride of calcium or magneeium in euitably arranged chambers, in accordauce with a receut patent.

Base Bullion and Silver Bars.

Iu the present state of financial affairs all ovsr the couutry and the difficulty of gstting coin or currency with which to carry ou ths businsss of the people, it is but natural that some plan should be suggested by which the base bers may rsadily bs reduced to silver bars of .900, and ovsr, fine. The difficulties that surround the men who producs bass bullion are much greater than thoss that mill men are obliged to encounter, and a remedy should bs had, at once, for the discrepancy until the two interests should be more equal. The difficulties now surrounding the ownsrs of furnaces could be relieved in no way so well as by ths erection of separating works near the furnaces. At ths present time the base bullion interest of this State amounts to fully 100 tone per day, and there is no means of getting it into bare except by transporting it to New Jersey or selling it at a price that would not be remuuerative to parties in San Francisco, to be ehipped to Swansea. In our immediate vicinity there is enough of base ore of late discovery to produce many tons of the bullion that would produce in silver from $300 to $500 per ton, but at the present time there is not capital euough in the State, that ie available, to carry on tho works until the usual time; from three to five months is consumed before returns in coin can be had. Unless some new arrangements shall be made, the working of base mines will, in a measure, be retarded. A remedy for this could be had in the establiehing of separating works at the ceuters of the production of base metal that would give to the smelter quick returns for his bullion. The interest account, when separation is delayed the usual time, is a large item and one that smelters should be pleaeed to avoid. In tbis way, only, can it be done, by erecting separating works of capacity sufficient to deliver clear silver bars to the smelter, leaving the lead as the result, to be utilized at a time when transporta ion shall he less. The smelters of Utah endeavored to provide for themselves and save transportation at high prices, and the interest account, by encouraging the erection of the Germania worke in that Territory. In the early smelting operations of Utah, they were sufficient to answer all purpoees of the smelters, but for some time past they have been obliged to sell large amounts of bullion to Eastern parties at a price that is not eatisfactory. Nevada needs works capable of separating one hundred tons per day of baee metal bars, eo that the silver coutained in them may be made ealeable at any commercial point or may be takeu to tbe mint and there made into Trade Dollars. So long as the present state of thinge exiets, there ie an incubus upon the mining and smelting intereet that should be at once removed. The fostering of these intereets is a duty, and much of the wealth of the State must be obtained in this way. It cannot be done without a cbange from the present situation. If there is a better way to relieve the present unfortunate position, it is to be hoped it may be adopted at an early day.—*Virginia Chronicle.*

The Big Gold Bar.

Tbe Butte *Record* of the 25th ult., says: Last week on Friday the Spring Valley Co. brought down from their mine a bar of gold valued at $71,500, the product of 5 weeks' run. We believe this is the biggest bar ever manufactured in the State. Since the completion of their Butte Creek Ditch, they have made two runs, one of four weeks, tbat cleared up over $40,000, and the preeent making a total of about $112,000, since the latter part of July. The boys made some little display over their trophy in briuging it down from their mine to Oroville. The vehicle coutaining it also conveyed several men armed with Henry rifles and revolvers and derringers. This was proceeded by another carriage occupied by Uncle Wm. Gregory, and another gentleman, armed with a Henry rifle aud a double barrelled shotgun charged with buck-ehot. In the rear was another armed guard. On arriving in town, the cavalcade halted at the banking house of Rideout & Smith, to deposit their treasure. While in the bank, and iu the endeavor to remove the caps from the shot-gun it was discharged, the coutente carrying away a portion of the wall, and a map hanging thereon. Some think tbis was done on purpose, and in celebrating their successful clean up. Whether so or not, it clearly demonstrated that, had Uucle William ever emptied the gun into the person of a footpad, who might imagine himself strong enough to walk off with the bar, the Coroner in holding an inquest would have struck an exteneive lead mine. The bar was safely landed in Sen Francisco, and was on exhibition among the attractions of Woodward's Garden on Sunday laet. The Cherokee mines with their preecnt facilities for working, will yield in the neighborhood of $50,000 per month, or $600,000 per annum. Scarcely a scar has been made upon the grounds of the Company.

OZOKERITE CANDLES.—Ozokerite is found in beds in the sandstone of Slanik, in Moldavia, in the neighborhood of mines of coal and rock-salt; it has also been discovered in the Carpathians. The material in ite crude state is brown, greenish or yellow; it is translucent at the angles, and its fracture ie resiuous. It is naturally brittle, but when softened can be kneaded like wax. It blackens on exposure to the air. It becomes negatively electric on friction, and exhales then tbe aromatic odor of a hydrocarbon. It melts at the low temperature of 66°. Its illuminating power is such that 754 ozokerite candles give a light equal to 891 of paraffine, or 1,150 of wax.—*Chemical News.*

MECHANICAL PROGRESS.

Heavy Versus Light Implements.

Many peoplo appear to be unaccountably stupid in regard to the most economical and convenient weight of implements and vehicles, and especially the weight of one-horse and two-horse vehicles. A large proportion of the four-wheeled and two-wheeled vehicles in use are sufficiently heavy and strong to bear three times as much, with entire safety, as they usually carry. The two-wheeled coal and dirt carts are often sufficiently heavy for a single horse without any load on them; and the huge four-wheeled express wagons are almost always built sufficiently heavy to carry with safety all that four or six horses ought to draw. There is great need of an improvement in regard to the weight of almost all kinds of implements and vehicles. A horse of ordinary size will draw, on a smooth road, one ton anywhere, with ease, besides the vehicle of suitable weight for one animal. In hauling earth of any kind, or stone, one horse would take 2,000 pounds with no more fatigue than he now feels when he hauls only seven or eight hundred pounds on a large lumbering cart, many of which will weigh ten to twelve hundred pounds without any load. It is truly surprising that intelligent men do not perceive this fact. By reducing the weight of a vehicle six hundred pounds, which could often be done with consistent strength, the team would be able to haul six hundred pounds more of earth or stone at every load, by exerting only the same strength. The same principles hold true in the construction of hand tools. A laborer shovelling earth with a shovel only one pound heavier than a neatly made light shovel, will exert strength to no purpose sufficient to throw up one pound of earth at every shovelful, which would amount to several tons in a short period of time. Many excellent teams are wellnigh ruined in consequence of a ponderous vehicle, as most teamsters are too apt to be governed by the number of pounds that is placed on the vehicle as a load, rather than by the weight of the wagon or cart, and the load in the aggregate. When farmers are hauling material of various kinds, they are not always aware of the unnecessary weight they require their teams to haul to and from the field. Hay riggings are frequently made more than one hundred pounds heavier than is necessary. If only made as light as consistent strength would admit of, a team might haul one hundred pounds more of hay and grain just as well as to draw the same number of unnecessary pounds of rigging. Plows are frequently made twenty pounds, or even more, heavier than is really essential to secure the necessary strength of materials. Every good plowman knows that an addition of twenty pounds to a plow that is already as heavy as it ought to be, greatly augments the fatigue of the team, and renders plowing far more laborious for the plowman than if his implement were as light as plows might be made for ordinary work. Farmers should study the strength of materials for the purpose of ascertaining as nearly as practicable how light every implement may be made consistent with strength.—*Colorado Agriculturist.*

Boiler Incrustration.

Our ten years' experience (says a writer) with hard water has given us a taste of what we were to expect in future, in the line of labor and expenditure, unless some remedy could be found which would effectually check the rapid destruction of our boilers from the deposits of lime. We were having no end of trouble from the leaking and burning of boiler-tubes, to say nothing of the increased amount of fuel used and dangers of explosion which are very much increased by incrustation.

A chemist having examined the subject of incrustation, proposed the use of tannate of soda. On his recommendation we at once ordered a quantity of the necessary material, and began using it. It required some little time before we could discover any effect produced, owing to the very heavy deposit of hard scale with which our boilers were coated. But in the course of a month we observed that our boilers required less coal to keep up steam, and otherwise seemed to do their work without so much driving. Upon examination we found the tubes perfectly free from scale, and in as good working condition as when first put together.

In June of last year we started a new 30-horse power Denemore boiler. This boiler has been in constant use ever since, using nothing but the hardest kind of water. Having occasion lately to open it, we found the tubes perfectly clean and free from scale of any kind. The inventor of the boiler, who was present at the time, was much surprised at the result, and declared he had never seen anything like it before in all his experience.

In regard to the amount of tannate necessary, much depends upon the character of the water used. At the rate we are now using it, the cost per annum is about $66 for three 30-horse power boilers. But as we use considerably less during the summer, when we get more soft water and require less steam for heating, the annual outlay will not be much over $50, and by it we save nearly $500 a year in fuel.

Ruled Test Plates for the Microscope.

In a recent paper read before the Quekett Microscopical Club, London, Mr. William Webb takes the ground that the alleged ruled plates of Nobert and others, purporting to present 200,000 lines to the inch, are illusions, it being a physical impossibility to cut any such number of distinct lines within such limits. He says:

That a micrometer with the lines the one 200-thousandth of an inch apart ruled on glass is an absolute impossibility. That if it be possible to rule lines themselves of the width of the one 200-thousandth of an inch, to make them definable there must be a clearly defined line between them, and a clearly defined line in the same plane of observation. That beyond the first few coarse bands of M. Nobert's tests, there is not, properly so called, a single line. That in the finest bands, except at their extreme sides, there is not half a line. That in the finest bands the only thing certain, except the edges, is the uncertain polarized aerial lines. That the microscopical world has been pursuing a phantom, and adopting a fallacy. That polarization of light in the examination of these and analagous tests is a deceitful servant of the microscopist.

That oblique illumination is another deceiver. That if M. Nobert were to attempt to fill his incisions with black, his finest bands would be merged each into one black line of the breadth of each particular hand. That a test must be a known thing which some power will either disperse or fail to define, as in the case of a spectacle vendor, who places before an intending purchaser's eyes words printed in types of different sorts as a known test of visual powers. That there are no tests so reliable as a known measured congeries of contorted lines, as in microscopic writings, where the transmitted rays are partially shut off by the black, and in which, the rays transmitted being transmitted by direct illumination, their definition is not interfered with; such rays becoming parallel rays, passing out at right angles with the surface of the glass, the unalterable law of natural optics being that the angle of incidence and the angle of reflection are equal.

Manufacture of Alloys.

An eminent authority gives the following as reliable directions for the most successful manufacture of alloys:

1. Heat the crucible to a red or sometimes a white heat, and then melt the least fusible of the metals composing the alloy. After fusion, heat this metal to such a heat that it will hear the addition of the next least fusible metal without too great a reduction of temperature.

2. Introduce the metals into the pot strictly in the order of their resistance to fusion, each metal being properly melted before the next is added. The danger in first melting one of the most fusible metals lies in the fact that it would most probably volatilize and become oxidized; this would be a source of great waste.

3. Heat each charge of metal thoroughly before adding it to the pot, thus avoiding as far as possible the reduction of the metal in the crucible.

4. When the proportion of zinc is large, and some of the component metals have a high point of fusion, the alloys should be covered with a layer of charcoal dust. If the alloys are rich in tin, the surface of the melted metal should be covered with sand.

5. Stir the metal before casting, and if possible when casting, with a whitewood stick; this is much preferable for the purpose to iron.

6 If possible, add a small portion of old alloy to the new one. If the alloy is required to make sharp castings, and strength is not a very great object, this proportion of old alloy to the new should be increased. In all cases a new or thoroughly well cleaned crucible should be used.

We noticed, in a recent issue of the *Scientific American*, a most curious device for propelling ships. Our readers have become familiar with some very odd plans, doubtless, but the palm of eccentricity should be awarded this. The patentee's idea is to utilize the dash of the waves and the rolling of the vessel in filling tanks along the side of the ship with water. These tanks are made by giving the ship a false exterior skin, through a portion of her length. Near the water line are outlets directed aft. The inventor expects, by means of the reaction of these upon the main body of water, to force the ship ahead. With commendable modesty it is suggested that the plan will, perhaps, be more serviceable as an auxiliary to steam and sails. When the very limited fall obtainable is considered, in comparison with the immense weight of water required to be carried, the absurdity of the scheme is sufficiently evident. We had thought the windmill-propellor man the most original genius, but after reading the *Scientific American's* description of this patent we are willing to hack the now aspirant to any extent.

Water Proof Wire-Work.—One of those very simple inventions which any one might have made, but which nobody did till M. d'Argy thought of it, consists simply in filling up the meshes of wire-work, of any metal or fineness, with an elastic varnish made of gume, oils, or other substances, which shall be merely impermeable and transparent. We can imagine hundreds of applications for such a simple invention.—*Iron.*

SCIENTIFIC PROGRESS.

The Zone of Life.

Insignificant as is the spot we inhabit, the zone of life—the area which not only all that live and breathe and move inhabit, but in which all vegetation is contained—is still more limited. From the submarine forests in the lowest depths of the sea to the highest altitude to which the condor soars, above perpetual snow, is but twelve miles! Within those scanty limits, six miles of air above us, six miles of water beneath, everything that has vitality is confined. If the salamander lives in the central fire, the exception is so small as scarcely to be worth mentioning. The air presses upon the earth with a force equal to 33 feet of water, and upon every average human body with a weight of 15 tons, which only does not squash us flat as pancakes, because the air surrounds us on all sides, including our insides, and thereby the weight is balanced. To most of us nature is one vast mirage, suggesting infinite delusions; and even to the learned many things still remain to be cleared up by slow-moving science in future ages. Who would imagine, upon the face of the matter, for instance, that, in an airless world, not a sound could ever be heard! On the contrary, in still and silent space, one might conceive that we might hear a pin drop from the moon. Hawksbee demonstrated the contrary of this fact in a memorable experiment before the Royal Society, 180 years ago. He placed a clock under the receiver of an air-pump, in such a way that the striking of the clapper would continue after the air had been exhausted; while the receiver was full of air, the sound was quite audible; when it was empty, all was silent. Again, when the air was introduced, there was a feeble sound, growing in intensity as the air grew denser. At the top of Mount Blanc, the report of a pistol is no louder than that of a common cracker let off at the level of the sea. "Above two miles," says Mr. Glaisher, who, as everybody knows, is an aeronaut of considerable experience, "all noise ceases. I never encountered a silence more complete and solemn than in the hights of the atmosphere—in those chilling solitudes to which no terrestrial sound reaches." On the other hand clouds absolutely facilitate the transmission of sound. Above a great city, to a hight of from 1,000 to 1,500 feet, there is always a noise "immense, colossal, and indescribable." The whistle of a steam-engine is heard at 10,000 ft., the noise of a train at 8,200, says M. Flammarion; but Mr. Glaisher testifies to have heard this latter when 22,000 ft. up in the air; the barking of a dog and the report of a gun rise each to 6,000 ft.; the shouts of a crowd of people, the crowing of a cock, the tolling of a bell, to 5,000; and the shout of a human being to 3,300 ft.—*Chamber's Journal.*

French Inventions in Telegraphy.—The French Telegraphic Department is reported the best in the Vienna Exhibition, and some of the inventions are exceedingly interesting. There is a machine that prints an autographic dispatch, not chemically, like the other autographic instruments, but on white paper, with printer's ink. It cannot be described in writing. There is synchronous action of two rollers; one may be in New York and the other in San Francisco, or in any other two places connected with a telegraph wire. A written message, a sheet of music, the portrait of a burglar, anything that can be drawn with a pen—not with a pencil—may be telegraphed from one end of the world to the other and reproduced with printer's ink on white paper, like that on which the patron of the *Journal* reads this item. Then they have a machine by which four operators can work over a single wire at once in one direction, just as one operator does with us; and by putting on four operators the other way you can make the capacity of one wire equal to that of eight by the old system. We are now using in America a system by which a wire can be operated both ways simultaneously. The French machine is exactly four times ahead of us. They have, also, an electro-magnet that works over one hundred miles of wire, and they will tell, within half a yard or so, exactly where a pneumatic tube has become obstructed. Suppose you have a tube between New York and Marquette, and a wad of paper, a rat, or something of that sort gets into it; you don't know exactly where to look for the obstruction, and it is a serious matter to go and dig up from one end until you find it—possibly not one hundred yards from the other. This machine tells you just where to go, although it will not tell you whether it is a rat or a wad of paper that stops the tube.—*Mining Journal.*

Carbolic Acid in a New Role.—In the course of his investigations upon the value of carbolic acid as a disinfecting agent, P. C. Plugge also studied its power as a reducing agent, and discovered incidentally that nitrate of protoxide of mercury containing traces of nitrous acid served as a delicate test for its presence. When a solution of such a salt is boiled with a solution containing carbolic acid, a reduction of mercury occurs, and the liquid assumes sooner or later, according to its dilution, an intense red color. The reaction is distinct in one sixty-thousandth dilution, and is manifest even when the dilution is one two-hundred-thousandth.

The Elements of the Sun.

Mr. Norman Lockyer read before the late session of the Chemical Section of the British Association, a paper on the elements of the sun. His object was to obtain the assistance of chemists in dealing with the sun and stars. After showing the processes by which with the aid of spectrum analysis he was able to discover the composition of the sun, he said Mr. Huggins and Father Secchi had both paid great attention to this subject, and from the result of their observations and his own he had come to the following conclusions:—(1.) The absorption of some elementary and compound gases is limited to the most refrangible part of the spectrum whou the gases are rare, and creeps gradually into the visible violet part and finally to the red end of the spectrum as the pressure is increased. (2.) The absorption of the photospheric light (and therefore the temperature of the sun) is much greater than is supposed. (3.) The lines of compound metallic vapors lie generally in the red end of the spectrum, and this holds good for absorption in the case of spectra like those of the metalloids, which are separated spectroscopically from those of the metallic elements by their banded structure. (4.) There are in all probability no compounds ordinarily present in the sun's reversing layer. (5.) When a metallic compound vapor is dissociated by the spark, the band spectrum dies out, and the elemental lines come in, according to the degree of temperature employed. Again, although our knowledge of the spectra of the stars is lamentably incomplete, he gathered from them that the sun, so far as its spectrum goes, may be arranged between stars with much simpler than those with much more complex strata. Sirius, as a type of the former, is the brightest, and, therefore, probably the hottest star in our northern sky. It is only known to contain hydrogen and magnesium, and the hydrogen lines in this star are enormously distended, showing that its chromosphere is largely composed of that element. There are also many other bright stars of this class. As to the latter class, the red stars may be quoted. They are lower in temperature than our sun, and here the quantity of hydrogen is greatly reduced. He had asked himself whether these facts could not be grouped together in a working hypothesis, which assumes that in the sun and stars are various degrees of celestial dissociation at work preventing the coming together of the atoms.

The young man who accompanied Mr. Light in the balloon sent up the other day, explains that during the descent a quantity of sand ballast was thrown out, but that the balloon fell so rapidly that "the sand flung overboard came rattling into the car as we passed it on our downward course." It will appear to most persons exceedingly odd that a balloon should fall through the air more rapidly than sand, and the aeronaut is of course mistaken in supposing that such a thing possibly could occur. All writers upon the subject of aerostation refer to the fact that when a balloon is in the upper atmosphere it attracts to itself, sometimes with considerable force, small objects which float near to it, and often, also a portion of the ballast that is thrown from the car. Such substances will cling to the balloon for a second or two, and then yield to the superior attractive power of the earth. The sand tossed out by the Herald's aeronauts seems to have been acted upon in this manner, unless, indeed, it was merely blown back into the faces of the aeronauts by a strong gust of wind.—*Philadelphia Bulletin.*

A dragon fly balanced on its wings at the side of a car speeding its way over the rails at the rate of forty miles an hour, appears to be almost motionless. But to keep up with the car its wings must vibrate many thousand times a second. The eye can not detect their up and down action, so exceedingly rapid are the contractions and relaxations of the muscles acting upon them. All at once they dart off at a right angle so quickly that the retina can not have an impression remaining long enough to trace their course. Therefore, those same muscles, to small to be seen but by powerful microscopic assistance, must be urged to still more rapid action. Such intense activity far exceeds the vibration of musical chords, and therefore exceedingly perplexes entomologists, because the nervous system of insects is so extremely minute. The question is: How much power is generated for keeping a dragon-fly's wings in uninterrupted motion for many hours in succession without apparent fatigue?—*Scientific American.*

Whether fish hear has long been a subject of debate among naturalists. Cuvier, Izaak Walton, Professor Cope, Mr. Lamberton and others have argued in the affirmative, but many naturalists of reputation have held to the contrary. Mr. Henry Lee, one of the curators of the Brighton Aquarium, directs attention to the question by citing several examples where it is evident that the porpoises contained in the aquarium tanks certainly heed the whistle used to call them to their meals. That they might not be attracted by the sight of any preliminary arrangements, a time was chosen other than that at which they were usually fed. Having placed an attendant where the movements of the fish could be watched, it was observed that at the first note of the whistle the porpoises instantly moved toward the end of the tank where it was their custom to feed. So far as this evidence of Mr. Lee's is pertinent, it only serves to prove that *porpoises* may hear.

Our Weekly Stock Review.

THURSDAY EVE., Nov 6, 1873.

The Stock Market has been pretty lively this week under favorable reports from various localities. The Consolidated Virginia stock has created considerable excitement. The mine has been closed to writers for eome time past, hut the uhiqnitous newepaper man has been down in the depths, and, from what he saw, thinks a first-class mine is fast heing heing developed. Aesays average from $379 to $443 per ton. The ore was struck on the 1,167-foot level, while the vein dips eaet at en angle of 46 degrees; hut a winze bas heen sunk 60 feet perpendicnlarly, all the way in rich ore. This shows the ore-hody to be wide. The reporter of the *Enterprise*, who has visited the mines, obscrves that the miners work away as if they were not afraid of breaking into harren ore, bnt hlast in all directione with the utmost confidence. On the third inst. the mine sent down $40,000, making altogether $111,000 from ore which milled about $100 per ton, and runs a little more than half in gold. The total bullion yield for the month was about $125,000.

The Belmont mines are attracting a good deal of attention just now on account of rich strikes in that quarter. The Belmont is sitnated in Nevada, ahout 150 miles from Hamilton, White Pine. The letter from Belmont, dated Oct. 29tb, saye: "Up to 6 o'clock this afternoon, at which time I left the mine, we had penetrated ore chute in winze cross-cut, Moore & Martin ground, to the extent of seven feet, with ore still in the face, and from appearances very eolid and of the same rich black ore. The entire seven feet in thickness now developed will not mill less than $1,000 per ton. Mr. Wright, of the Monitor Company, to-day made four assays of tbe richest and pooreet piecee, which gave the following reenlts: No. 1, $3,-024.92 per ton; No. 2, $3,468.51; No. 3, $197.91; No. 4, $508.96. In tbe bottom of Camfield North no more work will he done in the qnartz for eome time, as our mein object there is to connect witb tbe large body of ore, ae shown in winze, as speedily as poseible. The width of the ore seam struck in the 180-foot level of the Highbridge is twenty inches. It extends into our ground thirty-seven feet. As this gives ns little or no ore above tbe level, it is of little importance for preeent results, but owing to its pitching eouth guaranteee a large body of ore in tbe new level, for which we are now einking."

Reports from the Consolidated Virginia under date of Novemher 1st are as follows: "I have shipped to your address thie day, as per Assayer's certificates, likewise to be forwarded, bullion as follows: 2 bare, Nos. 25 and. 26, valued at $6,375.79, from Mariposa Mill; 4 bare, Nos. 27 to 30, valued at $12,996.88, from Bacon Mill; 4 bars, Nos. 31 to 34, valued at $4,411.13, from Bacon Mill; 2 hars, Nos. 35 and 36, valued at $403.38, from Mariposa Mill —12 hars, aggregating $40,187.13, heing final returns of hullion on Octoher account from the above mills."

Tbere is considerahle interest also manifested in American Flag, the Superintendent of which telegraphs Nov. 3d. "Drift is in 10 feet; ore, 4 feet wide: aseays, $140." Under date of Octoher 29th, the Superintendent says: "Since the last there hes heen eome improvsment in the shaft. Tbe vein is 20 inchee wide, ehowing some ore on the foot and hanging well quartz, etc., in tbe center. Full depth of shaft helow the eighth station is 26 feet. No other changes of importance.

The New York Consolidated has also been creating some excitement on the etrength of an expected strike. Under date of November firet the Superintendent writes: "We sunk 30 feet during the last month, which makee the shaft 387 feet deep. We used 45 cords of wood. We hoisted 3,800 gallons of water per hour on an average. The main body of quartz hae left the shaft, pitching to the east, hut tbere are otber small seams running in on the west, which ehow eigns of running into fine ore, and from the looks and formation of the rock and the amount of water that we have, I thiuk we are liahle to run into a large body of good ore at any time."

Consolidated Amador turned out $52,000 in October, and a dividend ie to he declared this month of 50 cente per share. It is turning out about $100,000 per month.

Eureka (Graes Valley) has already declared a dividend of $1 per share, and Belcher will pay $4 per share, or $416,000.

Water in the Careon river is on the increase, and very soon the bullion production will begin to inorease materially. Altogether the mining proepects for the coming season are very good, indeed.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

M. & N. W. S. M. Co.—Alpine *Miner*, Nov. 25: A emall force has heen working on the dam during the week. The heavy stone and timber foundation is about completed, and the timhers for the beavy apron are in place. The judgment in favor of L. L. Lewie, upon which the execution mentioned last week was haeed, has heen set aside by order of the Circuit Court, and work on the Silver Glance shaft will he resumed in a few days. Some of the men have already resumed work.

THE SCHENECTADY MILL made a clean-up yeterday from a rnn of 11 tons, and obtained 48 pounde of amalgam, worth about $400, or nearly $37 per ton. This crushing comprised the entire width of the vein, inoluding the waete rock contained therein. The vein ie gradually getting wider ae they sink, and the rock taken out now looks hetter than ever. If tbe body of ore continnes ae good as at present, all will he well with the Tarshieh.

THE SCHENECTADY MILL,— *Miner*, Nov. 1: This mill ie not running, and we understand that Superintendent Hunter has discharged most of his working force, witb the intention, however, of starting again as soon as some necessary repairs are made and financial arrangements completed.

M. & N. W. S. M. Co. has resumed work botb at the dam and in the Silver Glance mine. Tbe steam pump is rapidly emptying the S. G. ehaft and levele of water. The 75-ft. level is already clear, and tbe deep mining movement that has been lately interrupted will he resumed in a few days. In the face of the west drift some rich feeders appear, and the seams ars increasing in breadth.

SILVER MOUNTAIN.—There is little of interest to report in tbis department the present week. We heer encouraging reports from the I X L and Excbequer, near Silver Mountain, hut are not sufficiently well posted to warrent any definite report from that locality.

THE *Chronicle* saye that Mr. Chalmers struck ore in tbe 100-ft. stope of the Exchequer mine last week that aesayed over $2,000 per ton. Tbat is very rich ore; but the Tarshieh of this place still takee tbe lead, having produced ore that assayed over $9,000 per ton.

IMPORTANT DECISION.—The Sscretary of the Interior, in a recent deciein in an appealed case between Francis Blain & John Watt vs. the North Bloomfield Gravel Mining Co. of Nevada county, awards tbe lands in dispnte (over 1500 acres of valuahle mining ground) to tbe mining company.

AMADOR COUNTY.

WEST POINT MINES.—Sutter *Independent*, Nov. 1: The eighteen stamp mill now in erection at Mosqnito will he in full blest in from twenty to thirty days. The Wolverine mine is red hot, and still heating. It ie producing an ample amount of rich rock, and ie running the mill up to its full capacity. The Harrie mill at Sandy Gnlch still breake with its perpetual crach the gold bearing rock.

NORTH AMADOR.—Prospecting shafts are heing snuk on both the east and west side of Tncker Hill, near the North Amador hoisting works. The body of ore struck recently in tbe main ehaft still holds ont well, bnt tbe company seem determined to continue their proepecting until they find another lead.

THE BERLIN MINE.—This mine is evidently destined to he

about 60 ft. and we are informed that they have struck rock which will pay $200 per ton, and the ledge continues to widen as they go down.

MINK SOLD.—We understand that the Bunker Hill gold mine, near Amador City, has been sold to Mayor Joseph Brown of St. Louis.

CALAVERAS COUNTY.

BIG CHUNK.—Calaveras *Chronicle*, Nov. 1: A miner working near Jesus Maria, the other day—an Italian—picked up a piece of gold weighing twenty-five ounces. That is the biggest "find" we have heard of for some time—quite remarkable for these degenerate mining days. A bushel basketful of such chunks would add considerably to a fellow's stock of contentment.

RICH ROCK.—We learn that extremely rich rock has lately been struck in the Good Hope mine at Mosquito. The rich quartz was discovered in the 200 ft. level, and is now being stoped out for crushing in the new mill. We have not heard how extensive the recent discovery is likely to prove.

DURYEA HYDRAULIC.—The past two months have been principally employed in "cleaning up" after nearly a year's run. When we state that in the Duryea claim over half an acre of bottom, upon which a bank of gravel, over 100 ft. in depth originally stood, has been recently cleaned, some idea of the labor performed, as the result of the past season's washing, can be obtained. We have no means of approximating the quantity of gold realized, but the proprietor informed us that the amount exceeded his expectations by thousands of dollars. The claim is now in excellent condition for the resumption of washing. New ground sluices have been dug and the rocks and other *debris* cleared away by the aid of a huge water power derrick.

BROWN & CO.—The incline tunnel has reached a length of 300 ft. in Tunnel ridge. Although the "lead" has not yet been cut, a fair quality of gravel is being taken out—sufficiently good to indicate that large returns will be realized when the pay-streak proper is reached. The gravel is drawn up the incline in cars by mules, a railway track extending from one extremity of the tunnel to the other for that purpose.

MOSER & HAWORTH, proprietors of the noted Spring Gulch claim, are also energetically preparing to take advantage of the coming rainfalls. They, however, have not ceased washing during the summer, and have been doing remarkably well throughout the entire dry season. During the winter they expect to be able to uncover a large section of the rich bottom of the gulch, and in the spring reap a golden harvest that will repay them ten-fold for their labor and industry.

BRACKETT & Co. have run their new tunnel 600 ft. into the ridge, and on Monday last struck the lead. The gravel is rich. A large force of hands is to be put at work as soon as a "breast" can be widened out to give them an opportunity, when the mine will undoubtedly resume its former handsome weekly payments. The gravel is so hard that it cannot be thoroughly washed without crushing, and a battery for that purpose will be erected as soon as practicable. The iron pipe intended for carrying water for milling purposes is already laid. A very large amount of money has been taken from this claim through a tunnel lower down the ridge, and there is no doubt but the new location is now prepared to duplicate the yield.

VEITH & SHEAN.—The sluices are to be raised for the purpose of affording a better dump for tailings, and everything put in shape for working to the best advantage. The claim is abundantly supplied with the most approved appliances known to modern hydraulicing, and as the bank of gravel is deep and rich there is no reason why the claim should not give an excellent account of itself this winter.

MARIPOSA COUNTY.

THE WASHINGTON MINE.—Mariposa *Gazette*, October 30: Most of the Working force on Washington mine has been discharged, the quartz at the new shaft failing to pay. The few who are at work now are sinking the old shaft. The intention of the owners is to sink it 250 feet deeper.

NUMBER NINE.—The quartz vein known as "Number Nine," situated near Quartzburg, has been recently reopened by Major Hardwick, who, it is reported, designs erecting a mill and other necessary machinery for working the mine. It is said to be rich.

QUARTZ MINING NEAR HORNITOS.—Several parties are at work at the old Duncan vein, near Hornitos, and some of them doing well. Two Mexicans took out over 70 ozs. last week, and another party had taken out 10 or 12 ozs., and had a hopeful prospect at last accounts. It is a pocket vein, and is liable to yield a rich harvest of gold. For mining on a small capital, there is no locality that offers a better field than the immediate vicinity of Hornitos.

NEVADA COUNTY.

NEW LEDGE.—Grass Valley *Union*, Nov. 1: The owners of the Plumas Eureka Mine, at Eureka Mills, have recently struck another valuable quartz ledge near their mine.

THE weekly report from the Kentucky is more favorable than usual. Drifting on the 200-ft. level, both east and west, shows a continued widening of the ledge, with free gold in gratifying quantities. The new opening west of the hoisting works consists in a stripping of the ledge for over 30 ft., revealing a vein of over a ft. thick of ore pronounced by the Superintendent to be all specimen rock. The unanimous verdict is that the mine is a second Idaho.

NORTH STAR MINE.—Work progresses satisfactorily in the new shaft. The clean up for the four weeks will be in the neighborhood of $15,000, not counting sulphurets. The regular clean up will be made to-morrow.

PLACER COUNTY.

NEW ENTERPRISE.—Placer *Herald*, Nov. 1: The six-stamp mill, which formerly stood at the Mammoth ledge in Lone Star District, has been purchased by a San Francisco capitalist, John Sanborn, and is now being moved and re-erected on Auburn Ravine, one mile below town, under the supervision of J. L. Bray. The mill is being reconstructed to save the gold by what is known as the Penniman process. By this plan the rock is crushed dry, and the gold is extracted from sulphurets in one passing through the pans, which pans are peculiarly adopted to save free gold, no matter how fine. The Penniman process is now used in South Carolina and Colorado with the most satisfactory results. Well-versed quartz men who have examined the process pronounce it the only method yet known to save all the gold at one working. Mr. Bray is said to understand his business eminently well, and he is quite positive he can work the ores which he has examined in this vicinity up to 85 or 90 per cent. of a fine assay. Should this mill by the Penniman process be proven to save the gold as well as is now reasonably claimed, its advent will create an epoch in the history of our quartz mines that will long be remembered with pleasure. Many of our mines now lying idle contain an abundance of rock which will pay well by a process that will save 90 per cent. of the gold; but which return but small dividends when crushed by the ordinary quartz mill. We regard the enterprise with favor, and when the mill starts working, which we understand will be by the first of December, we shall hope to hear of it proving successful, equal to the anticipations of the most sanguine.

THAT COAL MINE.—We have received some specimens of the coal taken from the mine at Lincoln. Its appearance is not that of regular stone coal, but we put some in the fire, and found it burned freely, and in a short time found a glowing cinder. If it is a good thing, as we hope it is, the people at Lincoln will soon have to commence repairing some of those shabby-looking houses which line the streets of that moral little burg.

BETTER AND MORE OF IT.—We had a conversation the other day with engineer Barney, of the St. Patrick mine, and he informed us that he never saw a better mine than the Crater Hill is getting to be. It has been good all along. They are now down 307 feet, and the deeper they get, the richer the rock. He informed us also that the company had just been adding to the mill, a self-feeder, which he describes as a most excellent improvement on the old method of feeding by hand.

SIERRA COUNTY.

BALD MOUNTAIN.—Mountain *Messenger*, Oct. 25: The Bald Mountain gravel company, of Forest City, are working about 75 men, and think by extra good management to be able to keep them at work till water comes. The management will consist in finding room for their gravel; it is looking now as though it were impossible to find room for much more. They have now on their dumps, over 23,000 car loads, and their cars are extra large. They have a little water, enough to wash about 75 car loads per week, which is not a drop in the bucket. It pays as well as usual.

SOUTH FORK.—The South Fork company at Forest City have their tunnel in about 600 feet in soft rock. The owners are sanguine of a good claim.

IMMENSE WHEEL.—Manson & Co., of the Downieville Foundry, are at work making a pattern for an immense wheel to be cast by them for the Independence mine in a few weeks. It will weigh five or six thousand pounds.

TUOLUMNE COUNTY.

THE GOOD HOPE AND IDAHO VEINS.—Tuolumne *Independent*, Nov. 1: These lodes are situated on the bank of the Tuolumne river, at the entrance of the Big Basin, and about four miles from Arastraville. The Good Hope and Idaho are considered as two veins in one—the Idaho being situated 200 ft. east of the former, with a 16 inch vein on the surface. The Good Hope shows a vein six ft. clear, without the gouges, at the bottom of a 25 ft. shaft—and croppings discernable and gold prospects along the whole length of the 1500 ft. claim. At a low estimate, the rock will work $15 per ton. The Idaho works, in a mortar, $35 per ton in silver, and $30 in gold. Four men are at present working on the lode. A hurdy-gurdy wheel is being erected with a 150 ft. fall pressure, although 350 can be obtained. Preparations for a five-stamp mill to be erected immediately on the premises, weather permitting. Free water and plenty of it the year round. The veins are most favorably situated for working, and the whole surroundings densely studded with magnificent timber of pine, oak and cedar. These are among the many good veins in the grand old mountains of Tuolumne.

IT is reported that the Consuella Quartz mine, in Cherokee District, owned by Mr. Warfield, has just been bonded for 60 days, to Quartz Johnson, of San Francisco, for the sum of $25,000.

MR. FUNCK brought into our office a fine piece of rock, about one-fourth gold, from the "Hidden Treasure" at Cherokee.

THEY are sinking on the Excelsior now. West Hill is superintending during the temporary absence of Colonel Wright. Mr. H. is a practical miner, and has been for a couple of years all through Nevada, and from his experience says that Tuolumne beats them all, and that he would not give this county, for rich mines, if properly developed, for that whole State.

TRINITY COUNTY.

HARD ROCK.—Trinity *Journal*, Nov. 1: More hard work, in the way of cutting bed-rock, has probably been done in the Union Hill claim, above Douglass City, than in any other mine in this county, and the boys have plenty more of it ahead. During the past month they have been working night and day and only have 30 ft. of tunnel to show for it.

THE Shasta *Courier* says: "Henry Foley, just down from the cinnabar mines in Trinity county, is full of confidence in the ultimate success of the quicksilver mines located there."

MILL UP.—Mr. Wm. Guthrie informs us that his new mill is up and will be in running order in a short time.

Nevada.

ELY DISTRICT.

MEADOW VALLEY.—Pioche *Record*, Nov. 1: The sinking of incline No. 3 has been resumed. The west drift is now in 200 ft., indications very good. The east drift is in 311 ft. The east drift from the 4th level is in 137 ft. A cross-cut at the 3d level has been run a distance of 47 ft.

AMERICAN FLAG.—High grade ore has been struck in the bottom of the shaft.

PIOCHE.—There are from 50 to 60 tons of ore on the dump, and more is being taken out. The new shaft yesterday morning was 394 ft. deep.

CHIEF OF THE HILL.—Made 14 ft. progress during the week in the cross-cut at the 360-ft. level. The west drift has also been run 14 ft. during the week.

WASHINGTON AND CREOLE.—The east winze has been sunk to a depth of 100 ft. A cross-bead has come in at the bottom of the prospect winze, cutting the ledge out.

SILVER PEAK.—The incline is now down 360 ft. The ledge is at this depth about 4¼ ft. wide. The drift at the 250-ft. level still shows an improvement in the quality of the ore.

SPRING MOUNTAIN TUNNEL.—The work of sinking in the tunnel continues. Ledge No. 2 has not yet been cut. The shaft is now 150 ft. in depth.

BOWERY.—The shaft is still being sunk, and is now 425 ft. deep.

CHIEF EAST EXTENSION.—The main shaft is now 271 ft. deep. Sinking on the ledge continues.

CAROLINE.—The men have begun a cross-cut for the ledge at the 425-ft. level. The shaft is now about 8 ft. below the 425-ft. station.

CONDOR.—Work is going on in a drift which the men are running for the ledge.

PIOCHE WEST EXTENSION.—The sinking of the shaft continues.

NEWARK.—Work is going on as usual—no new developments being reported.

STILL SINKING.—The Ivanhoe and Pioche-Phenix are still sinking.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, Nov. 1: Daily yield 200 tons of ore. The Bacon, Mariposa and Occidental mills are kept steadily crushing ore from the mine, and are making rich returns. The ore breasts are gradually being widened out, and worked in almost every direction from the point where the extraction of ore was commenced. The average assay from the main south breast last evening was $263.90. Average assay of car samples from the Gould & Curry dump for the last 24 hours $122.50. The north winze is down 65 ft., the entire distance in rich ore. The tub samples from this winze for the past 24 hours have averaged $114 per assay value, while a sample taken from the lowest point reached, gave $229.17. The main east drift at the 1000-ft. level to tap the upper part of the ore body and give ventilation to the mine in making good progress. A drift east has also been started at the 1200-ft. level to cut the ore body at the point nearest the shaft and is soon expected to reach the ore vein. Sinking the main shaft was resumed yesterday.

CROWN POINT.—Daily yield 450 tons. The winze north from the 1300 to 1400-ft. levels, has completed the connection, giving a fine circulation of good air. The middle and south winzes, from the 1300-ft. level, are both being driven vigorously ahead, the bottom of both in fine ore.

DAYTON.—The south drift, at the second station, is still in fine ore. The main north drift at this station struck into and has been run the full size of the drift, a distance of 30 ft., in a strange, partially decomposed and blackish looking body of ore, exceedingly rich in gold, which promises one of the richest and most permanent developments of ore ever made in that section.

BELCHER.—Daily yield 450 tons of ore, being all the mills can crush. The incline is down 141 ft. below the 1300-ft. level, the sinking making good progress. The main south drift on the 1300-ft. level is in 432 feet from the Crown Point line, the face still in ore.

SAVAGE.—The east cross-cut on the 1700-ft. level is still driven vigorously ahead, the face in hard blasting rock. Sinking the main incline is making good progress.

OPHIR.—There is little or no change to report except the general progress of the several prospecting drifts at the various levels.

NEW YORK CONSOLIDATED.—Sinking the shaft is making excellent progress. It is now down 365 ft., having passed through during the week a fine stratum of ore 20 inches to 3 ft. in thickness, pitching to the eastward, and which is undoubtedly but a feeder from the main ledge.

JUSTICE.—The prospecting drift north at the 300-ft. level is still in good ore. A north drift has been started on the 400-ft. level to strike this body of ore.

CHOLLAR-POTOSI.—Daily yield 120 tons of ore, the assay value of which is $34 per ton.

SIERRA NEVADA.—The mill is kept steadily running on ore from the mine.

CALEDONIA.—Enlarging the shaft for a third compartment is completed with the exception of some necessary timbering.

JACOB LITTLE.—Driving the main northwest tunnel vigorously ahead.

YELLOW JACKET.—Cross-cutting on both the 1400 and 1500-ft levels is continued with no change to report.

GOULD & CURRY.—The prospecting drift east on the 1600-ft. level is still driven ahead, the rock in the face quite hard, with occasional seams of quartz. The face of the east cross-cut on the 1500-ft. level is in hard blasting ground.

SUCCOR.—The ore in the west drift from the second station shows considerable improvement, and is gradually widening as the work progresses westward.

SILVER HILL.—The new pumping machinery is all in place, and works splendidly. Sinking the shaft for a new level was resumed last evening.

EMPIRE.—Still driving the east cross-cut on the 1700-ft. level.

IMPERIAL.—Sinking the main incline is making fair progress.

TYLER.—A station has been opened at the depth of 215 ft., and a drift started east for the ledge.

DANEY.—Sinking the new shaft is making excellent progress. The shaft is now down 265 feet.

UTAH.—The new station at the 250-ft. level is opened, and a main west drift started for the ledge.

OVERMAN.—Opening the second station and starting a drift at the 1,200-ft. level is making steady progress.

SUTRO TUNNEL.—The header in the main tunnel made the connection with the drift from shaft No. 1 on the 27th, making the total length of the tunnel 5,224 ft., over one-quarter of the entire length of the whole tunnel.

BALTIMORE CONSOLIDATED.—There is no change of material value to report in either the first or second stations.

JULIA.—The main southwest drift at the 900-ft. level is making good headway and is soon expected to reach the ledge.

HALE AND NORCROSS.—Sinking the main incline is making good progress, although the rock in the bottom continues both tough and hard.

THE Blue Tent Consolidated Hydraulic Mining Company is an English corporation, of Nevada county, California, and owns 500 acres of mining ground, with an average depth, from surface to bed-rock, of 450 feet. The outlet for the tailings is the South Yuba river, which gives them a fall of 500 feet below bed-rock. The *Transcript* says that the ground owned by this Company embraces the claims formerly known as the Darst, Smith & Cooper, Enterprise, Empire, Bond & Kilham, Gopher, South Yuba, Blue Lead, and other smaller claims, embracing all the principal mining ground in Blue Tent District, unless we except the Central and Sailor Flat property.

IN THE HYDRAULIC MINES of Calaveras county, preparations for an active winters' campaign upon an extensive plan of operations, are being made in every direction. As soon as it rains enough to furnish the necessary water, work will be commenced in good earnest and upon a larger scale than has been witnessed for years. Hydraulic mining has been so successful during the past two years that as soon as water comes, a new and increased impetus will be given to it. Calaveras county is not alone in its hopeful prospects, but all the gravel mining districts of the State are anxiously awaiting rain to begin work with renewed vigor.

THE San Gabriel mines must be doing pretty well, according to the Los Angeles *Star*, for that paper asserts that $416 was cleaned up in 21 days by four men. They are, however, awaiting the action of the English capitalists, in relation to the projected sale. The *Star* says that at present there are believed to be one hundred pounds of gold locked up in the sluice boxes, and there are about seventy-five men at work in the cañon.

A FINE body of ore has been struck in the Lawton shaft of the Eureka Consolidated mine. The *Sentinel* says that the development establishes beyond question the existence of a mammoth deposit at that particular point; previous workings having disclosed the same body in another direction. The Consolidated is now looking first-class in every part.

SUIT has been instituted in Salt Lake City against the Emma Hill Consolidated Mining Company, for the recovery of 6-7ths of the South Star Mine, Little Cottonwood, and $75,000, back rents.

The Sugarie.

Beet Sugar in California.

Sngars are at the present time lower in price than they have been in many years. The current sqnotation for white refined is 11 cents, against an average quotation during years past of 15 to17 cents. This price, it is well understood, is below the cost of manufacture, and has been established by a peculiar complication in the competition between San Francisco refiners. It is, in fact, below the New York cost of producing the same article from the best and cheapest cane sugars in the world—those of the West Indies. It is also generally known that the onterprise of certain prominent citizens of Sacramento in inaugurating several years ago the industry of sugar heet culture and sngar production in California had not heen remnnerative. It has, however, become reoently nnderstood that the operations of these gentlemen during the past year, notwithstanding the ahnormal depression in the value of their product, have heen highly profitahle; and the sum of $40,000 is named as approximating the net profits of the enterprise—equal to a dividend of twenty per cent. on the capital (nearly $200,000) invested in it. With refined cane sugars selling at the cost of production, say 14 cents, the corallary follows that the profits of the new industry would be much larger—a rate of return upon the capital required, that is calenlated to promote its develment in the State and add permanently one more to the numher of her wealth-producing resonrces.

The Sugarie.

The refinery or "sugarie" of the Saoramento Valley Beet Sngar Company is situated near Brighton, four miles east of Sacramento. The company cultivates several fields to the sugar beet in the immediate vicinity, though its largest farm is at Davisville, Yolo county. The main huilding is a rectangular structure, some 50 feet wide by 150 feet long, with wings and an end building connected by a hridge. A branch railway runs directly past tho sugarie, bringing the beets from the Davisville plantation and taking away the products of the estahlishment. The beets are dumped under a shed at one end of the building, and are transported hy an endless helt to

The Washer.

This is a horizontal rolling cylinder by which the beets are carried through a stream of water to remove the adhering earth. The "washer" discharges them into a series of buckets attached to an endless belt, which elevates thom to a hopper within the building, where they fall upon a

Revolving Cutter.

From the cutter they pour down in a stream of shavings, and are received into barrows, in which they are transported directly to a set of large cylinders, called

The Battery.

This apparatus consists of a series of 14 iron boiler-plate cylinders, closed at hoth ends, each 8 feet in length by 3½ feet diameter, set vertically. In the upper end is a circular door through which the cylinder is charged; at the lower end is another door through which the refuse of the beets, after the sugar has heen extracted, is emptied. This refuse is carried to the outside of the building hy an endless belt, where it is dumped and then carried away by carts to convenient points about the gronnds and piled in long piles to he used dnring the winter as cattle feed. The process of extracting the sugar from the heets begins, properly speaking, in the cylindere of "the battery." The process is absolutely continuous from week's end to week's end, by day and by night —the only interval being hetween midnight Sunday, and the commencement of work on Monday morning. In order to hegin with the beginning it is necessary therefore to take up the work on Monday morning.

The cylinders are then "charged" with the hredded beete from the cutter, each cylinder containing from 2,200 to 3,500 pounds, an average charge being 3,000 pounde. The amount used dopends mainly on the temperature of the weather, and the percentage of sngar contained in the heets under treatmont—the higher the temperature the less the amount of charge. The quantity put through the hatteriee, however, is abont equal for equal times, for the lighter chargee require less time for their separate treatment. After charging the cylinders the next step of the prooese is to admit hot water to cylindor No. 1. Pure water is used only onoe during the week's work, tbat is, at the heginning of operations on Monday morning. Having started the operation with water, it is maintained during ite continnance with dilnted beet juice. At the top of the huilding, elevated fifty-four feet above the battery, is a tank filled with cold water. Cylinder No. 1 having been filled with hot water, the cold water from the roof tank is turned in and forces the hot water, together with the partly extracted jnice, out of cylinder No. 1 in o No. 2, and from No. 2 into No. 3. After having passed through No. 3 it is suffioiently chargod with beet jnice to be ready for the next step in the process.

The juice and water which has passed through only two cylinders ie made to pass into a steam heater where its temperature is raised, and whence it sgain pasees to a tbird cylinder of the battery. Here it receives a furtber accession of beet juice and is then ready for further treatment. The operation here indicated is maintained without intermiseion throughont the week. Water which has received an infusion of juice from a single cylinder is forced next to the heaters, thence to a second cylinder, through that, extracting from its charge a further infusion of juice; again to tho heaters and thence to the third cylinder, where it procures its final accession of juice. When each charge has been thus treated three times it is drawn and a fresh one is placed in the empty cylinder. The different cylinders composing the hattery are so connected that any of them can be disconnected from the circuit which is still complete among the remaining ones. Thus there is no interruption to the continuity of the process, although it is interrupted in each cylinder barely long enough to draw the exhausted charge and refill it with fresh beets.

From the battery the strong juice is next forced to a hoiler in which

Lime is Added,

And the temperature of the liquid raised to the boiling point, while at tho samo time it is treated with gas introduced through a worm. The purpose of this step is to free it from impurities. The liquid is thence forced through

Strainers

Of highly ingenious and effective construction. Upon a number of rectangular iron frames are stretched pieces of strong burlap cloth. The frames are then set flat against each other in a heavy cast-iron frame, and pressed together by a screw. The jnice, containing the admixed lime and impurities brought with it from the batteries, is forced hy a powerful pressure through the above described strainers. The burlap cloth arrests the lime and other impurities, and the purified juice strains out between the frames at their planes of junction, and flows thence to a closed iron vessel connected by pipes with vats situated in the tower at the top of the huilding. By turning a jet of steam into this vessel the juice is forced up through these pipes into the vats, whence it undergoes a further process of purification hy

Filtering through Bone-Dust.

The filter is in the form of a cylinder, divided hy partitions into several chambers which are all connected by a system of pipes. The jnice is made to pass through two of these compartments in succession, and the arrangement of pipes is such that any one of them may be discounected from the system without hreaking the connection among the others. Thus as each division of bone-dust hecomes saturated with impurity it may be disconnected, emptied and a fresh charge added without interrupting the coutinuity of the filtering process which is going on through the other chambers. There are six of tbese chambers or separate filters, and each one will run six hours before it becomes necessary to renew its charge of bone-dust.

At this stage of the procoss the juice contains about 10 per cent. of saccharine matter. The next step is one of

Concentration.

The juice passes from the hone-dust filters into boilers where its volumo is reduced by boiling, and is then passed a second and last time through the filter, by which the last particles of foreign matter are extracted. The color of the juice is now a pale gold. The remainder of the process is one of "boiling down," by which the percentage of water is progressively reduced until the sugar crystalizes, when the syrup is expelled by mechanical action, and pure sugar procured. In the operation of extracting the saccharine juice and its purification the steps thus far described may be designated as the mechanical ones of the process. The soluble substances extracted from the beet are not saccharine solely. One constant element which is also fonnd is common salt—the proportion varying with different parcels of heets. Traces of other soluble salte may also be found. Although the relative quantity of these is minute, it is still necessary to eliminate them before the final boiling; and thie ie done by the introduotion at different stages of the mechanical purification of different chemical reagents. The detail of the uee of these will depend on the preliminary analyeis of the raw material under treatment. Up to the present stage of the process, also, indications of the course and success of its operation are afforded by the colors successively aesumed by the juice. Attached to most of the apparatus described are thermometers arranged to indicate the temperature of the juice at different stages.

The eaccharometer—an appar tus that indicates the percentage of sugar in its solutions—gives the quality of these at any moment. In practice, all of these thinge are in use. The degree of heat to he given at the eeveral steps of the process may vary with the different readings of the saccharometer and the color of the juice. The particular form of sugar to be nltimately produced from a given quantity of juice may, in some cases, depend on these observatione. It will he correctly inferred tbat tbe practical management of works of this olass demands an antecedent training, and that the degree of success attending their operations will be found intimately dependent on the judgment and practical knowledge with which these are directed.

We have followed the juice to the stage of its final purification. The liquid now consists of saccharine matter and water—including under the first term the pure sugar, together with the inseparable coloring matter which ultimately remains in the syrup. From its second filtering the juice passes constantly into the

First Vacuum Boiler,

In which a vacuum equal to six inches of pressure—that is, equal to a six inch column of mercury—is maintained; and in this it is kept at a temperature sufficient for ebullition. The use of vacuum boilers is to produce ehullition at successively lower temperatures, for otherwise the sngar would become dark. From the first vacnum boiler the juice, now the consistence of thin syrup, passes into a second, in which a vacuum equal to 26 inches is maintained. Here it remains until the saccharometer indicates that it is concentrated to 40 per cent. of sugar; the remaining 60 per cent. is water. Hence the thick syrupy liquid passes into the last boiler, a large copper globe, in which are set thiok glass windows admitting the operator to view the process going on within. In this boiler the vacuum is maintained at 22 inches, producing ebullition at a temperature of 63 degrees (Rean), and during this boiling crystalization begins. The color of the intire mass is now rather darker than tbat of the "golden syrup" of the refinories. The operator judges the progress of the boiling by the appearance of the semi-fluid, drawing small portions of it from time to time upon a plate of glass, and observing the degree and character of the crystallization. When the formatiou of pure sugar crystals is complete, the mass is drawn off into large iron buckets, and allowed to stand for some six hours to cool off. It is then put into

The Centrifugal Machines.

These are iron vessels some four feet in diameter, which revolve at tho enormous velocity of 1,200 revolutions per minute. The semi-fluid mixture of sugar and syrup is emptied into one of these, and it is set in motion; as a high velocity is attained, the viscous charge is forced by centrifugal force to lay itself like a coat of plaster against the sides of the machine. Pressed against these by the centrifugal force developed, tho syrup is made to drain off, leaving a coat of pure white dry sugar lining the machine. This is removed in cakes, and in its present form is the "granulated" sugar of commerce. It is also the material of the crushed and powdered. To produce the first a pressure of steam is turned on the sugar while in the centrifugal machines, under which it forms into a more compact mass, and this is afterwards passed through a crusher. From the crusher, besides the lumps that constitute the "crushed" sugars, so called, a portion comes out broken fine and powderod. Falling on a series of graduated sieves, the very finest is set aside as "powdered" sugar. The larger particles go into other grades. Of these products it is to he remarked that they are absolutely pure sugar—classed as one hundred per cent. under analysis. Refined cane sugars of the highest grade are never more than ninety-seven per cent. sugar to three per cent. of foreign matter.

The syrup from the centrifugal machines flows into a tank, and is again hoiled hy itself in the vacuum hoiler. The effect is to produce a second crystallization, which, however, is not colorless. This mass is also put through the centrifugal machines, and the sugar extracted constitutes the "C," or "Yellow C" of the refineries. The syrup expelled from this second crystallization, is drawn off into vats in which it is allowed to stand several months and then make a third and still darker grade of sugars.

For the facts contained in the foregoing account of the "Sugarie" of the Sacramento Valley Beet Sugar Company, the readers of the *Record* are indebted to Mr. F. Riedel (assistant under the Superintendent of the Works, Mr. L. Von Ernstein), who kindly gave bis personal attention, and every information asked for, to the representativo of this paper. The facts stated in its opening paragraph indicate the efficieucy of management by Mr. Ernstein and his corps of aseistants.

Some Other Facts.

The sugar company at present raise their own heete. Their yield per acre varies between 5 and 15 tons. The soil suitahlo for the crop is a light loam. They offer $4 per ton for all beets delivered at the sugarie—a price which appears ineufficient to stimulate the cultivation of the crop by general farmers. The percentage of sugar in the beets varies, those now under treatmen containing about 10 per cent. The requirement of the establishment is 9,000 tons during ite working season of six months. The profits of the husiness would he increased could it bo prosecuted all the year round; but it is found that in the warm climate of California the beets ferment after being taken from the ground, and hence the manufacturing season ie limited to the growing soason. It ie not impossible that this drawback may in time be overcome by experiments in different ways of piling and storing the beets with a view to preventing fermentation. The history of the failures that for several years attended the effort of this company to manufacture sugar at a profit is familiarly known in Sacremento. In brief, it may be summed up in these words, "incompetent management." Its final success, more than equal to the anticipations that had been formed of it, is a matter in which the whole State may join in congratulation.—*Sacramento Daily Record.*

The assessed value of the property of Sonoma county for the year 1873, as returned to the State Board of Equalization, is $16,176,660; that of Mendocino county, $4,865,839; Lake county, $1,672,223. Sonoma stands the sixth county in the State in wealth. The total assessed value of the State is $629,768,505.

Pine leaves are said to be utilized in Europe as a substitute for hair in upholstery, and will make a kind of flannel very superior for bygenic purposes.

Amador County Mines.

The Sutter Creek *Independent* says:—The prospects of Amador county were never before so flattering as now. The advances which we are making in our industries are founded upon the great natural resources of our county, and are of such a nature that they will be permanent and lasting. Our mines are paying better than ever, and the work of the past few years in gold and silver mines here and elsewhere has shown conclusively that the greater the depth the richer and more permanent the ledge. At a depth of 1,700 feet the Amador mine has an excellent ledge of rich rock, and in the lowest levels of the Lincoln and North Amador mines the prospects are quite as favorable. The developments of the Lincoln mine, made during the past few months, render the present milling facilities of that Company entirely inadequate, and a new forty or sixty-stamp mill will be erected next year. The twenty-stamp mill with which their crushing is now done is of old-fashioned construction, and of comparatively small capacity. But even with these facilities, such is the richness of their rock, that their monthly proceeds reach a remarkably high figure.

The early completion of the Amador Canal is now an assured fact, and with it will come facilities for working many valuable mines now lying idle, as well as opening up rich gravel deposits which will render our hydraulic mining interests among the most important of our industries. The Lone Narrow Gange Company has now sold the amount of stock required to enable the road to be built, and will immediately commence active operations. Within a year we confidently expect to see this road completed within the boundaries of our county, furnishing cheap transportation for our goods, and giving us a market for our coal, copper and agricultural products. It will be a road controlled hy no rich monopolists who would grind us down by exorhitant freights and fares, but owned and governed hy persons who are interested in the development of the county through which it passes.

Our coal and copper mines are destined to become a great source of wealth to the county, and the completion of this road will be the direct means of enabling us to work them with profit. Even at high rates of transportation the Newton copper mine has shipped its ors to San Francisco, and realized a reasonable profit. Copper is used in the arts and manufactures in greater quantity than any other metal, except iron; and as the amount used is constantly increasing, there will be a greater demand for it. With our mines of gold, copper and coal, with thousands of acres of land susceptible of cultivation, and capable of growing coreals and fruit, and with an abundance of water and cheap transportation soon to he furnished, we regard our future as extremely encouraging.

The Mono and Flagstaff Mines.—Our reporter yesterday paid a visit to the office of the Mono Mining Compsny, of Dry Cañon, near Jacohs City, for the purpose of examining some extraordinary ore taken out of the mins. We found at the office ahout twenty pounds of ore, the remainder of a sixty-pound houlder taken from the mine recently, and assaying $12,000 to the ton. The specimens we examined were almost purely metal, and tho least scratch upon them with a knife or sharp instrument readily exhibited their richness. The Mono ie one of our most substantial mines. All the ore from it is shipped direct to Chicago, 250 tons having been sent there during the month of September. Their main shaft is now down 600 feet, and the Company is constantly consigning oro for shipment to the East. At the invitation of Superintendent W. H. Howland, of the Flagstaff mine, located at Parley's Park, eight miles east of Little Cottonwood, we visited the Company's office and were shown some exceedingly rich ore from this mine. The mine is principally owned by a Michigan company, and is turning out immense quantities of ore daily, which, unlike the Mono ore, is covered into bullion here without the expense of shipment to the East.—*Salt Lake Tribune, Oct.* 28.

Little Giants.—Last year there were eighteen of these improved hydraulic pipes in use in this county, and they worked so well that the number will he more than trebled this present season. J. R. Driver, agent for this county, gives ne the following list of parties who have ordered Giants within the past few weeks: Harvey Bros. and Balch & Rule, Weaverville; Trotter & Smiley and Charles Tourot, Douglas City; Hagar & Haas and Chapman & Fisher, Junction City; Joseph McGillivray, (two); Wolsky & White, Cañon City; V. Chamberlain, Rush Creek; John Smith, Eastman's; G. F. Deinor, Minersville. Besidos these, others have lately arrived that had been ordered direct from the manufactory, among which were two for Isaac Woodbury's Hay Fork claim, one for John Mahou & Co., Weaverville, and several for other parties, whose names we not call to mind. Our miners are now puzzled do know how they got along so well heretofore without the Giant. The general opinion seems to be that a mining claim cannot he worked without one of them, and that even two or three will be found a paying investment.—*Trinity Journal.*

Domestic Economy.

Talk to Housekeepers.

[Written for the Press.]

There is nothing in this country so often misunderstood as the term, housekeeper. To many people, especially young people, this name suggests only the scrubbing and dish-washing of some coarse, vulgar person, perhaps a frowzy-headed servant girl in a greasy gown with sleeves perpetually rolled up, and hands and arms garnished with pot black. And it is a lamentable fact that in a great number of houses housekeeping has gone almost entirely into the hands of this class of persons; while, as a natural consequence, perhaps, there has sprung up all over the land a vast army of boarding houses, which wage war with the homes and are fast exterminating them.

Multitudes of women are enticed into boarding by the *ignis fatuus* of a life of ease and freedom from care, and their husbands by visions of economy, as it often does cost less money to hoard than to keep house. And what is the result?

No woman can be truly happy without enough duties to occupy her mind, and make her feel that she was put into the world for some good purpose, nor can she be healthy without sufficient exercise to keep her blood in circulation. She can not have these in a boarding house, so she settles down into a pale, nervous dyspeptic, or becomes one of those novel-reading, gossiping, artificial sort of creatures, not worthy of the name of *women*, and good for nothing but to spend money, and annoy and disgust sensible people who are so unfortunate as to be obliged to come in contact with them. And what are the children of such women? They never are children, in the true sense of the word, for they are brought up under such forcing influences that as soon as they emerge from babyhood they change immediately into pitiful little imitations of fast men and women.

Now, this is all wrong. Human beings can not become what the Almighty intended them to be without *home* influence, and that is never found in any hotel or boarding house. Every family, especially where there are young children, should have a house to itself. If your circumstances do not allow you to buy a house, rent one; and if you cannot afford to rent a large dwelling, you will likely be as comfortable and happy in a small one.

If you are just commencing housekeeping and buying furniture, don't spend all your money on the parlors and have nothing left for the kitchen, which would be like the boy who thought he could "do very well without shoes," but was "really suffering for a bosom pin." Better furnish your kitchen and a comfortable family sitting room first, and leave the parlor till the last.

One important qualification of a good housekeeper is *order*. She should not only have a place for every thing, and know where that place is, but a regular time for every thing, particularly meals. If you can possibly endure having your fashionable sensibilities so dreadfully shocked, have dinner as early as one o'clock, or not later than two. This will save your family a great many doctor's bills.

Under the head of order comes also the matter of keeping books. You should put down everything that is spent, and what it is spent for, and never allow bills to run up for anything. Nothing in the world makes Mr. Smith so irritable as to have unpaid bills presented to him, with perhaps a long list of articles that were used up several weeks or months before. If Mrs. Smith managed as Mrs. Jones does, this trouble would be avoided. When Mrs. Jones commenced house-keeping, she supplied herself with a few small memorandum books, in which she carefully noted all her expenditures for each day, marketing, milk, groceries, etc., etc., putting in all the little items. After having found out what sum would cover a month's household expenses, she showed her books to Mr. Jones, and proposed that he should put into her hands at the commencement of every month, the sum that was needed for that month's outlay. Mr. Jones, being a reasonable sort of man, agreed at once to her proposition, and things have gone on quite smoothly in that house ever since.

Many mistresses make bad servants by the way they treat them; Mrs. Robinson, for instance, would be quite indignant if told that she made companions of her servant girls, yet she spends a great deal of time gossiping with them in the most familiar manner. When she has a new one, which is quite often, she never gives her any particular orders, but allows her to take her own way till something goes wrong, and then commences to find fault. As a natural consequence of this treatment, the girl loses respect for her mistress, and her authority being gone, there is no end to trouble till the girl leaves the house.

When you hire a servant you engage her to do your work, and to do it in the way you wish to have it done; therefore you should tell her in the very beginning what her duties are to be, and how you wish them performed. Every day you should make a thorough inspection of the kitchen and other places she has charge of, and if you find things are not as they should be, you should tell her so, kindly but firmly, and see that she puts them to rights. Many servants can be cured of careless, slovenly habits by this supervision. Have a lock on your store room door, and keep the key yourself; and go into it yourself every day to give out supplies for the day. It is no kindness to any servant, except perhaps an old and trusted one, to have control of the household stores.

One of the first considerations in the mind of every housekeeper should be the health of her family, and this is largely dependent upon their food. I will venture not to say not one woman out of every ten, perhaps twenty, in this country who is a housekeeper, knows how to prepare food properly. I know of families that sit down to the table every day and have messes placed before them to eat, which are actually fit for nothing but to be thrown to the pigs.

Mrs. Brown, for instance, is a very strong, hearty woman, with what we may call a cast-iron stomach, and about as much delicacy of taste as a rhinoceros. She can eat a good supper of hot bread and beans at nine or ten o'clock at night without having her slumbers at all disturbed by visions of defunct relatives; and thinks it is "all nonsense for people to make a fuss about how their food is cooked." Mr. Brown, poor man, is a martyr to dyspepsia. May the fates preserve us from the tender mercies of any of this class of vigorous feminines!

If you are a housekeeper or intend to be one and don't know how to cook, don't rest till you learn. If there is no one to teach you, buy some good treatise on cookery and study it and with the aid of a little common sense you will soon be able to prepare at least a few, plain, substantial dishes, which are after all the most important part of a meal.

Many woman object to housework because, they say, it spoils the looks of their hands. Well, that is a serious consideration if, as in many cases, a woman's looks are the only recommendation she has; but there is a great deal of housework a woman can do which will not injure her hands in the least. She can make beds and put things to rights in the sleeping rooms and parlors, and she can make bread and cake and puddings and the paste for pies. She can set tables and arrange closets and cupboards and drawers, and with an old pair of gloves on can sweep and dust and do a hundred other things all over the house. And the exercise obtained in this way will have such a beneficial effect on the complexion, that not near so large a quantity of artificial whitening and brightening will be required as perhaps had been used before.

Useful Information.

Everlasting Fence Posts.

I discovered many years ago that wood could be made to last longer than iron in the ground, but thought the process so simple and inexpensive that it was not worth while making any stir about it. I would as soon have poplar, basswood or quaking ash, as any other kind of timber for fence posts. I have taken out basswood posts after having been set seven years, which were as sound when taken up as when they were first put in the ground. Time and weather seemed to have no effect on them. The posts can be prepared for less than two cents a piece. This is the recipe: Take boiled linseed oil and stir it in pulverized charcoal to the consistency of paint. Put a coat of this over the timber, and there is not a man that will live to see it rotten.—*Homestead.*

We have never tried the plan recommended above, but give it for the benefit of our readers. If it shall prove to be true that posts so treated will last so much longer, it is certainly worth knowing; for fencing material, in many localities, is becoming very scarce where once it was plenty. The process is not an expensive one, and we hope some of our readers may be led to try it.

Varnish for Iron.—The following is a method given by M. Weiszkopf, of producing upon iron a durable black shining varnish: Take oil of turpentine, add to it, drop by drop, and while stirring, strong sulphuric acid, until a sirupy precipitate is quite formed; and no more of it is produced on further addition of a drop of acid. The liquid is now repeatedly washed with water, every time refreshed after a good stirring, until the water does not exhibit any more acid reaction on being tested with blue litmus paper. The precipitate is next brought upon a cloth filter, and after all the water has run on, the sirupy mass is fit for use. This thickish magma is painted over the iron with a brush; if it happens to be too stiff, it is previously diluted with some oil of turpentine. Immediately after the iron has been so painted, the paint is burnt in by a gentle heat, and, after cooling, the black surface is rubbed over with a piece of woolen stuff, dipped in and moistened with linseed oil. According to the author, this varnish is not a simple covering of the surface, but it is chemically combined with the metal, and does not, therefore, wear off or peel off from iron.

Fire Kindlings.—Take one quart tar, three pounds rosin; melt them; when somewhat cool add one gill spirits turpentine, and mix as much sawdust, with a little charcoal, as can be worked in; spread out while hot on a board; when cool break up in small lumps, about the size of hickory nuts. They will easily ignite with a match and burn with a strong blaze long enough to burn any wood fit to burn. The above sells readily in all our large towns and cities at a great profit.

How to Preserve your Furs.—Furs, says a writer in one of the New York papers, who seems thoroughly familiar with the subject, should never be put away for the summer, and forgotten, as they so frequently are; and next to being shut up from the air, their greatest enemy is damp. If from the wearer being exposed to rain, they become wet, they should be dried at a moderate distance from the fire immediately; and in warm weather, when not required for wear, they should never be shut in a box or other drawer for more than a few days at a time, and every few weeks they should be shaken and beaten.

The more delicate skins require somewhat more delicate treatment. The best plan is probably, not to pack furs away, but let them lie in a drawer or wardrobe that is constantly being opened so that they meet the eye frequently, and being thus often in sight, it is easy at convenient opportunities, to have them taken out and beaten, or, at any rate, shaken or tossed, and thoroughly exposed to the air. It is common to hear it remarked, that the moths get into furs—as if the insect actually migrated from one locality to another; the probability is, however, that furs and woolens are animal substances, endowed with vital principle, which develops itself into the living organisms through the decay of its material shape. Cleanliness and airing are, therefore, absolutely essential.

Paper bags, folded over the seam and sewed together, make excellent receptacles for furs and woolen garments. Cedar chests are better, if you can obtain them.

Good Health.

Bathing.

Bathing is not only an act of cleanliness, but is in an eminent degree conducive to health. The fine and sensitive pores of the skin soon become torpid, and their delicate and most important functions are suspended by the solid materials in the perspiration and the accumulations of filth, and require very frequent ablution with water, to preserve their normal condition, without which no person can be healthy, happy or comfortable. The mere wearing of proper clothing and washing of the more exposed portions of the body, and the frequent changing of clothing, is but an imperfect attempt at cleanliness, without being accompanied by entire submersion of the body in water, either tepid or cold. It must be admitted by every sensible person, that there is no more real appreciative luxury than a pleasant general bath when the system is in a proper condition to receive such a bath; it is, in fact, one of the most valuable but most neglected hygienic remedies we possess.

We admit that many people are insceptible of taking cold, and are, so to speak, "living barometers;" but even to such the warm bath would always prove advantageous. One-half or more of the rheumatic twinges, swollen limbs, and cramped joints that occur in such persons, would yield to proper perseverance and confidence in this potent alleviator. For ordinary purposes, care must be taken that a warm bath is not used at too high a temperature at first. As a general rule, we would advise, more especially in cases where some chronic diseases is firmly located, rising the warm bath for a few days, first followed by the tepid bath, then the cold. In all cases, whether the warm, tepid or cool bath is used, the first should be of only a few minutes duration, which soon may be increased to ten or fifteen minutes at a time, care being taken never to remain immersed sufficiently long to induce a sensation of cold on coming out. A healthy reaction should follow the bath, and a pleasant glow of warmth should diffuse itself over the surface of the body. If this be not the case, the bath has been indulged in too long, or injudiciously taken. When any symptom appears that contra-indicates the use of the cold bath, the tepid, warm, or vapor bath may be substituted, according to circumstances. At any rate, keep the skin free and active by some kind of bathing, the frequency of which must depend upon all the surrounding conditions and habits of each life.—*Manufacturer and Builder.*

Destruction of the Germs of Disease.—As the result of a series of experiments on the destruction of low forms of life by heat, Dr. Grace Calvert demonstrates that the germs of disease will withstand a temperature of 300° Fahrenheit. Exposure to such a heat as this injures the fibers of all kinds of cloth so seriously that they are unfit for further use. It is therefore evident that the mere agency of heat cannot be depended upon for the destruction of germs or corpuscles attached to the clothing of persons who have suffered from any contagious disease.

The necessity for a change in opinion regarding the power of chlorine gas to accomplish this purpose is urged in a recent report of the New York Board of Health on the disinfection of clothing and rooms that have been exposed to contamination by small-pox. In the report in question, carbolic acid is especially recommended for the disinfection of clothing and bedding, and sulphurous acid gas prepared by burning sulphur, for the disinfection of rooms. The latter substance especially, seems to have the power of utterly destroying the germs of small-pox, while chlorine frequently fails altogether, or only accomplishes the object in an imperfect manner.

The greatest care should be taken in the preparation of food for the sick. It should be *just right*, or the weakened and sensitive appetite will refuse it. If gruel is scorched in preparing, or whatever you attempt fails the first time to be as nice as it should be, throw it away and make more. Be scrupulously neat in serving it up. Use your prettiest dishes and finest napkins. Something depends upon looks; and the eye of a sick person may be unusually critical. Except in the preparation of light puddings, the process of *baking* is inadmissible for the sick. Roasting is better—a light roast potato is sometimes very acceptable. Meats should be delicately broiled, except when boiled for broths.

Earth Poultices.—The value of earth as a disinfectant and deodorizer is well known, and the treatment of ulcerated sores and gangrenous wounds with it is becoming very general. A new application of this system has lately been described—namely, the use of clay as a dressing for the face in two cases of confluent smallpox, dusting it in fine powder over the faces of the patients as soon as the pustules became fairly developed. This, it is stated, formed a clean, dry, wholesome scab, absorbing the infectious material, scaling off during convalescence, and leaving the underlying skin in its natural and normal state. The painful and persistent itching which is well known as one of the worst characteristics of the disease was by this simple means entirely abated. The earth used was fine pipe clay.

Inoculation with Cholera.—Dr. Obermyer, a physician of Berlin, known for his researches upon the subject of typhus fever, became recently a victim to his professional enthusiasm. For the purpose of investigating the nature of cholera, and the means of its cure, and especially as to its contagious character, he caused himself to be inoculated with blood from a cholera patient. The world gained the information that cholera could be communicated by inoculation, but lost a doctor, for the unfortunate experimenter took the disease, and, although a large number of his colleagues united their skill to save him, he died after a few hours, suffering a martyr to the cause of medical science. The above is on the authority of the *Gazette de Cologne.*

Celery as a Remedial.—A correspondent of the *Practical Farmer* says: "I have known many men, and women too, who, from various causes had become so affected with nervousness that when they stretched out their hands they shook like aspen leaves on windy days; and by a daily moderate use of the blanched foot-stalks of the celery leaves as a salad, they became as strong and steady in limb as other people. I have known others so very nervous that the least annoyance put them in a state of agitation, who were in almost constant perplexity and fear, and who were effectually cured by a daily moderate use of blanched celery as a salad at meal times. I have known others cured of palpitation of the heart by the use of celery."

Lie Down and Rest.—Dr. Hall says the best medicines in the world, more efficient than all the potations of the *materia medica*, are warmth, rest, cleanliness and pure air. Some persons make it a virtue to brave disease, "to keep up" as long as they can move a foot or wiggle a finger, and it sometimes succeeds; but in others the powers of life are thereby so completely exhausted that the system has lost all ability to recuperate, and slow and typhoid fever sets in and carries the patient to a premature grave. Whenever walking or work is an effort, a warm bed and cool room are the very first indispensables to a sure and speedy recovery. Instinct leads all beasts and birds to quietude and rest the very minute disease or wounds assail the system.

Lard as an Unguent.—It is well known that rubbing the body with hog's fat has the effect of reducing the temperature of the skin in scarlet fever. Fr. Ketz, of Heilbronn, directs to incorporate one or two grammes of carbolic acid into one hundred grammes of lard, and, with this, to rub the whole body, excepting the head, two or three times a day, according to the intensity of inflamation characterizing the case in hand. The effect of this kind of treatment is to produce a pleasant feeling of coolness, to keep the skin softer, and after each application the temperature of the skin falls somewhat. The carbolic acid operates to destroy the germs and spores of the disease.

Clothing.—For all persons, especially invalids, an under material of wool gauze, next to the skin is the safest and the best, because it is a non-conductor and carries heat from the body more slowly than cotton, linen or silk. The warmer the weather the more need for wool next the skin. All garments worn next the skin during the day should be removed at night and spread out for a thorough airing and drying. Cotton is the best material to be worn next the skin at night. All changes from a heavier to a lighter clothing in the summer should be made by putting on the lighter clothing first thing in the morning. It is safer for children, for invalids and old persons to have too much clothing than too little.

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Kustel's Improved Reverberatory Furnace, 289. Progress at the Sutro Tunnel; Observations at High Elevations; Patrons Industry, 296. The World's Wheat Supply; Self-Adjusting Self-Oiling Loose Pulley; Napa Gang Plow; Academy of Sciences, 297. Monopolies and the People, 300.

ILLUSTRATIONS.—Kustel's Improved Reverberatory Furnace, 289. The Napa Gang Plow, 297.

MECHANICAL PROGRESS.—Heavy vs. Light Implements; Boiler Incrustration; Ruled Test Plates for the Microscope; Manufacture of Alloys; Waterproof Wire-Work, 291.

SCIENTIFIC PROGRESS.—The Zone of Life; French Inventions in Telegraphy; Carbolic Acid in a New Role; The Elements of the Sun, 291.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 292.

MINING SUMMARY from various counties in California and Nevada, 293.

DOMESTIC ECONOMY.—Talk to Housekeepers, 295.

USEFUL INFORMATION.—Everlasting Fence Posts; Varnish for Iron; Fire Kindlings; How to Preserve your Furs, 295.

GOOD HEALTH.—Bathing; Destruction of the Germs of Disease; Earth Poultices; Inoculation with Cholera; Celery as a Remedial; Lie Down and Rest; Lard as an Unguent; Clothing, 295.

MISCELLANEOUS.—Engineering at the Sutro tunnel; Chemicals in Pan Amalgamation; Base Bullion and Silver Bars; The Big Gold Bar; Ozokerite Candles, 290. The Sugarlo; Amador County Mines; The Mono and Flagstaff Mines; Little Giants, 294. Silver a Legal Tender; Cheap Transportation; A New Australian Steam Line; Barley to Liverpool; Silk Manufacture in the United States; The Mineral King Mines; New Discoveries of Quicksilver; Extensions; Ship Property at New York, 298.

Progress at the Sutro Tunnel.

As we stated briefly last week, on Monday morning, October 27th, 1873, the first connection was made between the east drift from shaft No. 1 on the line of the Sutro Tunnel and the main header. These two drifts have been steadily approaching each other since the middle of August last, at which time they commenced excavating from the shaft, and though it was expected that they would shortly come together, the connection was made rather unexpectedly—the first intimation of it being the result of a blast in the east drift from the shaft which threw the dirt into the other hole, leaving the drill hole intact. This hole was filled with a wooden plug; a large charge of giant powder was inserted, and the opening created through which the foremen, miners and spectators eagerly crowded, all anxious to be among the first to get on the other side.

The result of this connection has been anxiously looked forward to by all connected with this great work, but by none more so than Mr. H. Schussler, the well known Civil Engineer, by whom the surveys were made. He had measured the distances by triangulations on the surfaces and had carefully calculated the grades until he felt confident that he was right and would make the two openings hit each other; but what was his gratification to find, on getting up his instrument after an opening of sufficient size was made through which to take observations, that there was only a difference of seven-eighths of an inch in the center lines, that the grades varied only half an inch, and that the distance from the mouth of the tunnel to shaft No. 1, when measured with a tape line, differed from that shown by the triangulations but two-hundredths of an inch!

Considering the difficulties under which the surveys were made, (mentioned at length in another column), this result is truly remarkable, and places Mr. Schussler in the first rank of his profession. The length of the tunnel from its mouth to shaft No. 1, is 4,885 feet. The drift west from that point has been run 312 feet, making the entire distance from the mouth to the header 5,197 feet. Shaft No. 1, which is 523 feet deep, will now be shut down, and all the rock will be taken out at the mouth of the tunnel.

Shaft No. 2, which is 4,150 feet from shaft No. 1, will he 1,041 feet deep, when completed. It has been carried down 746 feet, and sinking by hand labor is progressing at the rate of about 8 feet per week. It is proposed, however, to have diamond, or other power drills set to work in this as well as the other shafts at the earliest possible moment, when the rate of sinking will be rapidly increased.

Shaft No. 3 is 4,480 feet from shaft No. 2, and will be 1,361½ feet deep when finished. It is now down 419 feet and has been sunk 8 feet during the past week. A very large amount of water is encountered at this point, no less than 18 miners' inches being pumped constantly, equivalent to over 300,000 gallons per 24 hours. The Occidental mine—over a mile distant—has been drained through this shaft, and springs over three-quarters of a mile in the opposite direction have dried up since the present depth was reached.

Shaft No. 4 is 4,150 feet from No. 3 and will be 1,485 feet deep when completed. It is now down 547 feet and is progressing at the rate of 10 feet per week. This shaft is 2,450 feet from the Comstock lode, which will be intersected by the tunnel at a depth of 2,000 feet below the Gould and Ourry croppings. The intersection will take place below the Savage hoisting works.

The entire length of the Sutro Tunnel will be 20,115 feet, or a trifle less than four miles. When shafts Nos. 2, 3 and 4 are down, there will be seven points from which drifting can be carried on instead of one as at present, and it is expected that the tunnel will be finished to the Comstock within two and a half years. The officers of the company are as follows: President, Joseph Aron; Vice President, O. W. Brush; Secretary P. W. Ames; General Superintendent, Adolph Sutro; Assistant Superintendent, H. S. Safford; Chief Civil Engineer, H. Schussler; Assistant Civil Engineer, Ross E. Browne; Chief of Mining Department, R. P. De Noon; Chief of Machine Department, John Anderson; Chief of Carpentere' Department, G. A. Taylor; Paymaster and Accountant, D. J. Bousfield.

Observations at High Elevations.

The discussion in regard to the proper place to locate the proposed observatory, to be built by James Lick of this city, has been entered into by so many people that the general public have almost come to the conclusion that it is to be built more for a sort of California wonder or exhibition than for any useful purpose. Mr. Lick himself, however, knows what he is about and probably pays little attention to the suggestions of newspaper correspondents or interested parties. Almost all the places suggested have been named and praised on account of their nearness to this city or favorable proximity to a railroad. Of course if the proper location for such an institution could be found near a railroad it would be a great advantage; but we venture to say that the largest observatory in the world would attract the attention of tourists and others, whether it was ten miles from a railroad or a hundred miles. If it were a little difficult to get there, perhaps, there would be even more visitors, on the same principle that miners always think the best diggings are the farthest off.

The observatory is to be built by Mr. Lick for scientific purposes, but he has probably some idea that it ought to be where people could see it as well. It is said that the location has been situated near Lake Tahoe, on the site mentioned in our last issue, as having been picked out by Colonel Von Schmidt. A deed of gift has been presented to Mr. Lick, by Mr. Bliss, owner of the land, for 78 acres. Of course there is plenty of water near by, or the engineer would have ignored the other beauties of the spot. The gentleman who presents the land, states that if Mr. Lick should, on further consideration, prefer any other locality, he will be entirely satisfied, as his only motive is to promote the purposes of Mr. Lick. This matter of the value of the land in the Sierras or anywhere is of very little moment to Mr. Lick, as that would be the least of the expenses connected with the undertaking.

We suggested in our last, that the best plan would have been to select a committee of well known scientific men to locate the site, but as Mr. Lick pays for the observatory, it is of course his prerogative to do as he pleases and he will no doubt do so. There is plenty of time before the telescope is built, for him to find out all he wants about the matter and if he thinks it necessary to change the site at present selected, it is an easy matter to do. The *Truckee Republican* in speaking of the site dwells on the clearness of the atmosphere and the comparative light fall of snow there, mentioning at the same time, that at Summit Station, on the C. P. R. R., which is about 7,000 feet above the sea, the prevalence of strong winds would be an obstacle to astronomical observations, and then the snow falls there frequently to a depth of from 15 to 20 feet.

Perhaps the *Republican* forgets that a series of observations, taken at this Summit Station, by the Coast Survey, in a very careful manner, prove it to be an excellent place for astronomical observations, and the conditions were much more favorable than as many other places in the vicinity. The experiments were to determine whether great elevations were better than small elevations for astronomical observations, and were conducted by Professor George Davidson, of the United States Coast Survey. A report of these experiments was forwarded to Benjamin Pierce, Chief of the United States Coast Survey, and was verbally communicated to the California Academy of Sciences, some time in October, 1872.

The station occupied by Professor Davidson was on the line of C. P. R. R., at "Summit," on the Pass of the Sierra Nevada, at an elevation of 7,200 feet above the sea, in lat. 39° 20′, longitude 120° 20′. The plan contemplated the using of instruments which Professor Davidson had used for years on the Pacific Coast, and observing upon objects with which he was familiar in the regular operations of the Coast Survey. His observations had extended through elevations from high-water mark to 3,471 feet above the sea.

Summit, at the head of Donner Lake, is in a gap of the Sierra Nevada, about 2,000 feet below the general elevation of the chain northward and southward. The summer winds draw through from the westward sometimes very strongly. At the time the observations were taken, the observers labored under the disadvantage that smoke from the great forest fires of Oregon, Washington Territory and British Columbia had drawn down the great Valley of the Sacramento and filled it nearly to the top of the mountains, obscuring the Coast Range, which is visible during the greater part of the year. The heated air of the valley was probably drawn through Summit Pass. An elevation of 9,000 feet, which could have been obtained within three miles of the Station, would have avoided these difficulties.

Professor Davidson examined the ridges of the mountains for several miles north and south, and was well satisfied that an elevation of 9,000 feet was available to railroad and telegraphic communication, but the question of the best location could be readily settled by an examination of the summit of the mountains further north and south within reasonable reach of communication. Peaks of 10,000 feet and over lie just south and west of Lake Tahoe near the Placerville road; and of 9,000 feet and over to the northward of Summit Pass. As far as the climate and opportunities for observing were concerned, Prof. Davidson's experience is within the month of July and part of August 1872; at Verdi in July there were only six nights cloudy, and the same proportion held good at the Summit. While he was at Summit every night was clear. In January, February and March, 1859, he was stationed at Table Mountain, north of this city, and could see the Sierra Nevada, 150 miles distant, as clearly as objects seen ordinarily 50 miles distant.

The meteorological observations kept at Summit from December 7th 1866, to the end of November 1867, show the following results:

MONTHS.	CLEAR DAYS AND NIGHTS.	CLOUDY DAYS AND NIGHTS.
December, 1866.....	6	19
January, 1867.....	19	12
February, 1867.....	13	15
March, 1867.....	21	10
April, 1867.....	23	7
May, 1867.....	29	2
June, 1867.....	30	0
July, 1867.....	31	0
August, 1867.....	30	1
September, 1867.....	27	4
October, 1867.....	27	4
November, 1867.....	15	15
358 days.....	270	88

In February one storm lasted thirteen days, and 10 feet of snow fell. The total snow fall for the year was 45 feet, and during February, March and April the average depth was about 13 feet. The hills were free from snow about May 1st, but 10 feet lay in some of the valleys. Weather frosty early in May, but flowers were in bloom in June. The winds were mostly east and west, the latter largely predominating. The greatest range of barometer was one inch during the year. Weather in summer is very pleasant and nights cool. The clear cool nights of winter were reported as marvellously clear.

As the mountain flanks are covered with verdure, there is a freedom of clouds of dust that prevail in strong winds eastward of the Sierras, where the rainfall, as far as Ogden, does not average more than ¼ of that or the Sierra.

In the concluding remarks, after enumerating the observations taken, Prof. Davidson's report states that from his examination he is satisfied that one or two daily observations for the diameter of the sun under similar circumstances would be better than six months' results at low altitudes. With his instrument he felt confident that he could observe with the same precision upon the sun as upon the moon, both for diameter and for right ascension and declination; and that the observations would have a value equal to the best observations upon the stars for latitude.

Patrons of Industry.

Under the above head we last week threw out the suggestion that the mechanics of this country would do well to unite in some organization similar to that which has met with such marked success among the farmers, under the title of "Patrons of Husbandry," shutting out from their councils all who do not sustain a fair moral character, and all such as make politics a trade or a specialty. At the same time we suggested "Patrons of Industry" as an appropriate name for such an organization.

And now, less than a week after said publication, we have received a New York journal from which we learn that only three or four months since a few earnest workmen of that city met for the purpose of considering and setting on foot the very thing suggested; and so well did they do their work that upwards of 70 lodges have already been formed, and a National Lodge was organized on the 7th of October just passed.

The work of the Order is secret, and conducted with as little ceremony as is compatible with such an organization. Neither politics nor religion can be introduced into the meetings, and no politician or speculator is eligible to membership. All applicants are subjected to a most rigid examination as to character and sympathy with the movement before their names can be even *proposed* for acceptance. The working of the Order and the results sought therefrom are similar to those adopted and sought for by the "Patrons of Husbandry."

As is the practice with the Patrons of Husbandry, and to the end that the Patrons of Industry may also become in the highest degree social, and of a character to improve and elevate the moral standard of its members, this Order also admits both sexes to membership, and requires at least two women to act as officers in each lodge. No lodge can be organized without them. In all organizations where men are associated with their wives and daughters and sisters, it is safe to infer that a pure moral atmosphere must prevail. The Order co-operates in business matters, especially in the matter of purchasing, whereby the extortionate profits of unscrupulous agents and middlemen are saved to the membership.

Although not political in its character, the members of the Order, like those of its sister institution, expect nevertheless, in their individual capacity to employ the ballot as an important aid for redressing the wrongs which have been heaped upon the working classes. The Order, as a body, while fully recognizing the cardinal principle of strict loyalty to the laws of the country, proposes to stand as a united phalanx against all kinds of misrule and against all persons or organizations which seek to oppress the industrial portion of the country with unjust taxes or burthens of any kind. It proposes to mow down monopoly and extortion everywhere. Its motto is, "By industry we thrive." By union it expects success. In secrecy it possesses power, and in right it has might. It believes that the prosperity of the industrial masses is the true road to the happiness of a people.

Local lodges confer three degrees—For men: Apprentice, Laborer, Journeyman. For women: Apprentice, Maiden, Matron. The officers are: Master Workman, Workman, Helper, Laborer, Secretary, Treasurer, Lodge Keeper, Watchman, Stewardess and Workwoman.

The State Lodge is composed of Master Workmen and Past Master Workmen, and their wives who have taken the Third degree. The National Lodge is composed of the Masters and Past Masters of the State lodges.

The rituals and all the work is simple, and the expenses of the maintenance of the Order light. Eight men and two women may constitute a subordinate lodge, and ten lodges a State lodge.

There are no oaths administered by the Order—members are obligated upon their sacred honor and written pledge. Much benefit, it is said, has already been derived in New York, from co-operative business matters set on foot by the Order, and the membership is claimed to be increasing so rapidly that it is expected that fully 1,000 lodges will be organized in New York city and vicinity by early spring. The membership is already set down at about 8,000.

A letter dated Oct. 21st, written by the Secretary of the National Lodge, which was organized Oct. 7th, says that over 40 applications for charters have been received in a single week—all charters now emanate from the National Organization.

If the Order continues in good hands and is administered strictly on the principles set forth in the Constitution, as published, we see no reason why it may not become as much a power for good among our brethern of the shop as the Patrons of Husbandry has already become among the tillers of the soil, and eventually take the place of all other organizations designed for the social and national benefit of mechanics, miners and laborers in general, other than farmers. Both of these Orders are working for a common end, and each may, and no doubt *will* co-operate to a greater or less extent with the other in many things for their mutual benefit. We hope to hear of its being planted on this coast at an early day.

Academy of Sciences.

The rsgnlar semi-monthly meeting of the California Academy of Sciences, was held on Monday evening last, Vice-President Hswston in the chair. There was a very full attendance. Joseph A. Donahoe was elected a life member, and E. G. Waite, Thomas Adam, Henry Michaels and R. W. Andrews, resident members.

Quite a number of interesting donations were made to the cabinet and library. Dr. George Henston presented as the gift of a friend, a magnificent set of publications, including the voyage of the *Bonito*, in seventeen parts, with three volumes of plates; also the voyage of the *Astrolabe*, made by order of the French Government in 1826-29, in twenty-two parts and five folio volumes of illustrations in natural history. The latter work was published at the cost of two thousand francs. There were also several volumes of illustrations from the voyages of *Venus* and *L'Ocean*. The Academy passed a vote of thanks to Dr. Hewston's friend, the unknown donor.

Rev. Mr. Williams gave to the Academy a French work on Ichthyology, published by Henry Estienne, in 1554.

W. R. Frink presented a miscellaneous collection of products and natural history specimens from the Navigator Islands. Among them was a species of gum, (from a tree) called "Tutui;" also lacto-resin or inspissated juice of a species of bread fruit tree, from the Hawaiian Islands. In reference to this gum or resin Mr. Frink stated that it is obtained by cutting through the bark, when a juice runs out of the color, taste and consistency of ordinary milk. In the course of 24 hours it fermente, and the gum separates like butter in the churning of cream; it can be obtained in large quantities in some of the islands of the Pacific. It is used by the natives to fill the seams of their canoes, and as plaster for cuts, sores, etc. For the latter use he had found it very valuable, and his opinion had been confirmed by the few surgeons to whom he had given samples for experiment. It is soluble in several fluids and may yet come into extensive use for making fabrics waterproof. Mr. Frink's collection was very interesting. The Palolo worm which he presented is seen floating in early morning in certain channels near Savai and Upolo, Navigator Islands. It is seen on only two days in the year. Its return is calculated by the natives with astronomical precision. It appears in great abundance and is caught only before sunrise, for as soon as the sun rises it disappears, to return only at neap tides in the months of October and November. It is esteemed by the natives as a great delicacy, hence "Palolo days" are days of festivity, and thousands repair to the channels to gather it. It is of all colors and the surface of the water at the time of its occurrence presents the most gorgeous appearance.

Mr. Stearns remarked that the specimens were too imperfect to determine their true relations; the fragments appear to be portions of marine worms allied to the *nereidæ*, and which resemble the terrestrial *myriapods* of which the centipede was a common illustration.

Another interesting collection was that made by Capt. T. W. Williams, in the Arctic. Prof. Davidson last spring furnished an outfit of bottles, alcohol, copper can for preserving, etc., and the captain brought back the following specimens: elephant tusk from latitude 69° 22′, large male walrus head with skin, etc., for mounting; female walrus head, skeleton; small dark seal; shells, etc. from pauncb of walrus; walrus parasites from pauncb; coal from Belcher Point. The walrus head and seal are preserved in salt. A great number of other interesting donations were made by other members.

Mr. W. A. Goodyear of the State Geological Survey read a paper on the High Sierra south of Mount Whitney, which we will publish next week.

Mr. Stearns read by title a paper by Mr. Henry Edwards, being the third of a series on "Pacific Coast *Lepidoptera*."

Mr. Dameron made a few remarks on fish culture, and the ova and young of salmon.

The Secretary read the minutes of a meeting of the Trustees and then read the deed for the Lick property. The action of the Trustees was indorsed and the property formally accepted.

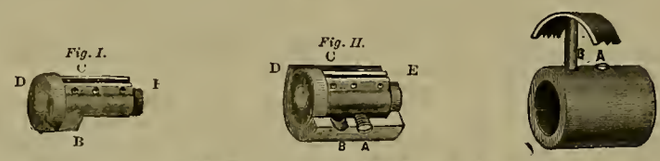
L. P. McCarty, for a long time general agent for our paper on this coast, will leave in a few days for a journey though the principal cities on the other side of the continent. He has authority from us which will enable business men to deal with advantage in patronizing our journal. He has our wishes for a pleasant reunion with his Eastern friends, whom he will visit.

The Comstock mills are gradually starting up their idle stamps and will soon be running to their full capacity, increasing, of course, the bullion yield. The Comstock mines ship by rail 80 car loads of ore per day.

A Self Adjusting, Self Oiling Loose Pulley.

The accompanying cuts show a self adjusting, self oiling pulley lately invented by Luther Knight and assigned to the Salem Self Oiling Machine Co. of Salem N. Y. Referring to the cuts, No. 1. is a bushing; No. 2. is a bushing seen in one half of the hub or pulley; No. 3. is the hub without bushing. It will be seen in No. 2. that there is a reservoir in the hub surrounding the bushing. This reservoir is filled with oil and a thumb or plug screw put in the oil hole as seen at *A* or *B*. The knob, *B*, shown in Fig. 1. being placed in the hole, *B*, in Fig. 2., the oil hole, *B*, is then continued through the reservoir to the shaft direct without communication with the reservoir. *C*, in Figs. 1 and 2 shows a slotted tube for packing, the oil passing from the reservoir to the packing through round holes in the side of the tube, *C*, and thence to the shaft. The oil is drawn to the shaft by attraction, as the pulley revolves.

The same amount of oil is given for lubrication at each revolution of the pulley, whether



SELF-OILING LOOSE PULLEYS.

running fast or slow. The tube, *C*, is turned off the same size as the large end of the bushing, so as to form a cut-off in the reservoir, by which means the oil is thrown directly in contact with the tube by centrifugal force. The bushing (Fig. 1) is turned a short distance at the ends, *D*, and *E*. The hub (Fig. 3.) is bored out so as to have the ends, *D*, and *E*, make a drive fit and retain the oil in the reservoir. The makers of this machine state that pulleys made in this manner will run from 10 to 20 months with one oiling. They publish several testimonials from parties who have used the pulleys, and who recommend them to others.

The Belmont mines are said to be turning out finely and new strikes are reported. The Canfield has a 4-foot ledge and where it has been exposed, the estimated value of the ore is $1,000 per ton. The El Dorado South Co. have struck rich ore at the 480-foot level, which will average $300 per ton. The strikes create a strong excitement both at Austin and Belmont.

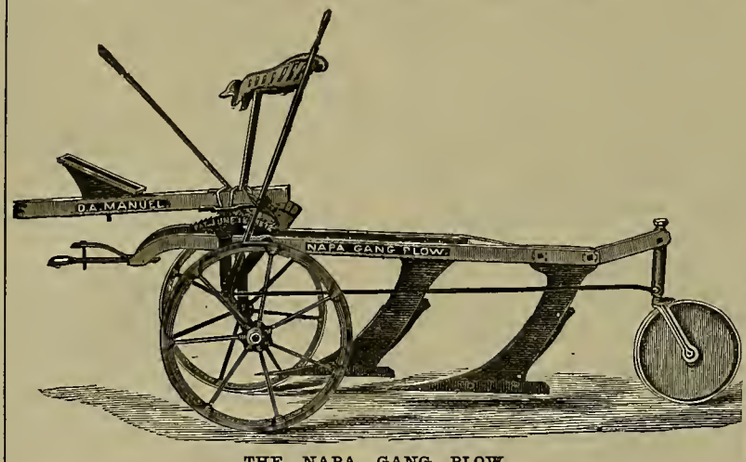
Perseverance Rewarded.—After three years of steady labor, both day and night, the Enterprise Mining Co., of Sucker Flat, have completed a bed rock tunnel, 2,500 feet long. This tunnel opens a vast amount of mining ground and the labor expended will shortly be handsomely rewarded. There is a scarcity of water complained of by miners in that section.

During the month of October the Branch Mint in this city coined the sum of $2,658,000. Of this $2,280,000 was in double eagles; $120,000 in eagles, $110,000 in half eagles, $50,000 in quarter eagles, and $98,000 in trade dollars. The total coinage for the four months ending October 31st was $10,135,500.

The Napa Gang Plow.

The Napa Gang Plow, of which we herewith give an illustration, is the invention of an old Californian, Mr. D. A. Mannel. The construction of this plow will be easily understood by reference to our engraving. Its peculiarities are the mode of lifting or depressing the shares, construction of the castor, and most important of all, the adjustability of the falling pole, by which the weight of the driver and machine is thrown off the horses' necks, a point said to be possessed by no other plow. Another advantage is the ease with which it is turned around, there being but little effort required on the part of the ploughman.

The plow has been made as simple as possible, and everything has been done to produce a gang plow within the reach of all, without impairing its effectiveness. In this view the whole apparatus is a marvel of economy, all material being so disposed as to give required strength, without adding unnecessarily to weight and expense. The Napa Gang Plow may be seen at the warehouse of Linforth, Kellogg & Co., Nos. 3 and 5 Front street. The plows are made in Napa City, in this State. Many of our interior towns would benefit them-



THE NAPA GANG PLOW.

selves materially by going into the manufacture of similar articles, even if only in a small way. Very few factories start large at first, and an undertaking such as this should be encouraged.

The Borers of the Sea.—Many stories are current as to how inventors have borrowed or stolen their ideas from Nature, and there has been much ingenious discussion as to whether hints thus appropriated are properly patentable. Boring is an example of natural processes that have been thus used by art, and it is remarkable that the lowest creatures are the most skillful mechanics in this particular. An eminent living inventor, who has made a fortune out of a patent auger, hit upon the method followed by the most successful insects which bore into hard wood. And so we are assured that the celebrated engineer, Brunel, in constructing the Thames Tunnel, but imitated the shell-lined burrow of the *Teredo Navalis*, or ship-worm. This mollusk in shape resembles a worm, and surrounds itself with a shell open at both ends. From the mouth it can protrude its short foot, and the other extremities of its body; the "tail" is bifurcated, one prong being the inspirator, and the other the expirator tube of the syphon, which constitutes the animal's nutritive apparatus.—*Popular Science Monthly.*

The University.—A building is being erected at the State University, to be used as an engine room. Steam will be generated to heat the College and to work the five-stamp mill which Booth & Co. of this city presented to the University. A movement is also on foot to procure a printing press and an outfit for a printing office for the students.

The International Bridge over Niagara river has been completed, allowing all-rail communication, via the Grand Trunk Railway, between Boston, New York, Buffalo, Detroit, Chicago and San Francisco. Transfers and ferriage are now avoided.

The World's Wheat Supply.

During the last winter, when speculation was rife as to the probable wheat yield of California and the world generally, a few of our wisest (?) writers seemed ready to predict that from that time onward, we had much to fear from the largely-increased yield likely to flow in from the countries around the Black Sea, and assuming that the extension of railroads into parts of Asia not before traversed by them, would permit of the wheat of those countries being delivered in England cheaper than it can be from California, and hence the policy of a very largely increased acreage over former years, was a matter of grave doubt.

Where are their predictions now? We hardly hear of the Black Sea country as furnishing any more than former years, nor do they put it in England's markets any cheaper than before. The fact is, the consumers of wheat throughout the world are increasing faster than the supply, and something besides new Asiatic railroads must be thought of, before the prices of wheat will be lessened in any of the great markets of the world.

The Champion Driller.—The Owyhee *Avalanche* says: We challenge the world to beat the wonderful feat of single-hand drilling accomplished this week by a Cornishman, named James Gooey, in the Golden Chariot mine. In one 8-hour shift he drilled 31 feet in very hard rock, and in four 8-hour shifts he drilled 110 feet, being an average of 27½ feet for each shift. The magnitude of this performance can be readily imagined when the fact is taken into consideration that good single-hand drillers only make from 10 to 12 feet in an 8-hour shift. Gooey is a small man, though of compact and sinewy build. We venture to say that his work of drilling 31 feet in solid rock on an 8-hour shift, has never been equaled anywhere in the world.

A Pocket vein near Hornitos, called the old Duncan mine, is doing well. The Mariposa *Gazette* mentions the fact that two Mexicans took out over 70 ounces of gold last week and another party had taken out ten or eleven ounces. This is a good locality for mining on a small capital.

The Schenectady mill recently cleaned up 48 pounds of amalgam from 11 tons of rock, or about $37 per ton. The Alpine *Miner* says that this crushing comprised the whole width of the vein, including the waste rock contained therein.

William Blyte was killed in the Idaho mine, Grass Valley, on the 3d inst., by a large rock falling down the shaft, while he was being hoisted in the bucket. He was a native of Cornwall.

Extensions have been taken up on the Washington mine, Kern county, until now it has been located a distance of 17,000 feet. If it "holds out" in proportion to its length, the locators ought to have a good thing of it.

The New Idria Quicksilver Mine suit, better known as the famous "McGarrahan claim," is now being tried in San José, Santa Clara county. The case is attracting much attention.

The total loss by the late fire at Reno, amounted to $100,000. The whole business portion of the town was destroyed, but large portions of the stocks in trade were saved.

The Eureka (Grass Valley) mine only ran about three weeks last month, and the result with 15 stamps, was about $32,000 worth of gold.

Bullion Shipments during October, from Los Angeles to this city, amounted to 2,984 bars, with only half the usual number of teams hauling.

Many of our gravel mining companies are anxiously awaiting the advent of rain, so that they will be able to have more water for piping.

A very rich channel, from 100 to 125 feet wide, has been found on the Table Mountain Blue Gravel Company's mine.

The total number of admissions to the Vienna Exhibition, which has just closed, was 7,250,000 from the opening to the closing day.

A Rich body of ore, supposed to be of great extent, has been found in the Cave mine, Bristol District, Nevada.

All the smelters in Salt Lake are again at work and bullion is moving as formerly.

Four weeks' run of the Idaho mine, Grass Valley, yielded $75,000 in gold.

Silver a Legal Tender.

The man who feared that silver would become a drug on the market, and the mine owners who were said to have contemplated the possibility of being obliged to suspend operations on account of the anticipated decrease in the value of the Queen of the precious metals were evidently not much accustomed to the study of political economy, or to giving much thought to the subject in question. For purposes of coinage, to speak of those of the arts, there is an increasing demand. India alone could, it is said, take five hundred million dollars in silver money, to supply its wants of small change, that is, an amount about equal to the produce of our Pacific Coast mines for twenty years to come, that is, should the present rate of production continue unchanged. So it is also in other countries, and now it seems that we are to feel the want of silver for coinage purposes ourselves. A return to specie payments seems at no distant day inevitable, and the making of silver a legal tender in the payment of small sums seems to be the first step towards it. It is curious enough that a scarcity of greenbacks, the *bête noir* of our political economists should be the immediate cause of the demand for specie. But so it has been. Men on Saturday evenings not being able to obtain greenbacks to pay off their hands have taken to paying in silver, and in Washington this now prevails somewhat extensively. Chicago has also sent $62,500 worth of silver bullion to the Mint at Philadelphia to be coined, and other places will follow suit. This is right; all amounts under twenty dollars should be paid in silver, that is, had we silver with which to pay them in. This we have not. Excluding California, the total value of all the silver coin in the United States does not exceed ten millions of dollars. Now to pay the wages of all our artisans, laborers, etc., we require at least sixty millions of dollars in silver coin. It is of course immediately impossible to obtain this. We should wait until our mines had produced it, and this at the present rate of production they could not do inside of a year and a half. Even then we would not have enough. Great Britain, which has not as large a population as has the United States, requires nearly eighty millions of dollars of silver coin. We would require as much of it, and this it would take considerably over two years to supply, always provided that the product of our Pacific Coast mines remained as it is now. The result of this will be with a silver circulating medium to give it a premium instead of as at present, having it at a discount. The immediate effect of the resumption of specie payments and of the instalment of silver in the post of honor would be to cause a fall in prices, not indeed immediately in California, but over all the rest of the Union. After a little while we would obtain all articles that we now import considerably cheaper, and would of course thus and so far be benefited, but looked at from another point of view this would work injury to us. We have now a flourishing manufacturing industry which has been injured not a little since the opening of the Central Pacific Railroad, by competition with the East. With lessened prices the competition would in many things become so great as to be unbearable, and the industries that were subject to it would inevitably have to succumb. This would of course be an evil so far as it went, but it could not begin to operate till some time was at an end, nor would it last for a long time, for goods could not be sold cheaply, but for the period of panic that would succeed the money tightness. It would however, have the effect of making money exceptionally tight, and interest rates would keep up, as of course those who held the money would know how to charge for it. This would for a time injure enterprise. It is evident therefore that the return to specie payments, and the paving the way for it by a silver legal tender would produce a temporary paralyzation of business matters and would tend to check industrial enterprise. It would, however, have a good effect in that it would stop the habit of importing more than we could pay for with export, and would necessitate the manufacture or production of the articles thus ceased to be imported at home. As to the effect upon our local import trade there would probably be absolutely none, all that we have said on this subject applying more to other parts of the Union, and to them probably for only a brief period. We will if we can produce it send away annually to England twenty million centals of wheat, which will bring at Liverpool at least $3.04 and a fraction per cental, or a total of $60,831,250, from which the only deduction that has to be made is for freight at an average rate of ninety-seven and thirty-three hundredths cents per cental. Taking away this, amounting to $19,466,000, there would be left $40,634,000 owing to us on wheat alone, for which we could buy English manufactured goods or goods of other countries sold by English merchants if we were so minded. Besides this we would send away $5,000,000 worth of Domestic Produce of a value of at least $6,000,000 abroad, making a total export value abroad of $46,000,000, for which we could buy foreign goods or demand coin. This is a low estimate of what the value *at market* of our exports would be, because there is no doubt that our Wine, Wool, and other agricultural exports would increase proportionately with those of our Wheat. Allowing it however to stand at that and adding the product of our mines, gold, silver and copper at least worth $80,000,000, we would have a foreign, that is, an Eastern, European, Chinese, etc., credit of at least $126,000,000. To this must be added the export value of the other States and Territories producing minerals and precious metals of say $14,000,000, and we have for the whole Pacific Coast a credit abroad of $140,000,000, one of $140 per individual or $700 per family. That is, that our surplus production would average more per head of workers than the whole annual average wages to-day. The inputus that the demand for silver coin would give to mining would be surprising. There would not be a foot of the Pacific Coast supposed to contain silver that would not be prospected by capitalists of Europe and Eastern cities anxious to participate in the immense profits to be derived from giving the country enough silver money. We have estimated above a minimum of demand for silver coin, but it is evident that the *real* demand would not be satisfied until we had replaced our greenbacks dollar for dollar, and fifty per cent. more to satisfy growing commercial needs, say six hundred million dollars. With the production of our mines duplicated this would require nearly ten years to satisfy. To include silver coin as a currency means at first contraction of values and financial panics East, lessening our importations, and increase of home productions, on the Pacific Coast renewed prosperity and better purchasing power, finally the settlement of what we will style American commerce and industry on a sound and financial basis, and a return of the prosperity of late years, without the dangers of their monetary system.

Cheap Transportation.

Commerce, now-a-days, cannot exist without roads penetrating the deepest recesses of continents, piercing the most tremendous mountains, and bridging the broadest and deepest rivers. In its infancy it was confined entirely to the sea-coast, and its earliest pioneers were hardy fishermen. Then it crept slowly from the coast towards the interior along the banks of navigable rivers, over mountain tracks and through wood-paths. The pioneer merchant carried his stock on his back like the peddler of older communities, or packed it on a beast of burden, like the early business men of the coast. Roads and wheeled vehicles succeeded. Now we have railroads—the highways of the nineteenth century. The older roads were the care of the nation, and to the community were free, save in the case of the payment of occasional toll or *octroi*, and of late years the necessity of the abolition of these dues has been a matter of almost universal recognition. In this country the present substitute for the common road—the railroad—is entirely in the hands of private companies, who naturally enough look to private profit—it is not the property of the State or nation, and consequently the minimum of charge has not been had. For a long time those who used the railroads of the land were so sensible of the benefits derived that they did not inquire too nicely into the charges paid; they were glad to have railroads at all—only too happy to pay well for the quick transport of their merchandise from the sea-board to the remotest interior of the continent. Then, too, the roads were anxious to get the traffic, and cut down charges very low. But this state of things soon passed away, the roads doubled and, in some cases, trebled the value of their stock by the issue of new shares, sold these shares to third parties, and then expected to be paid the same interest on their nominal capital that they had been on their real. This necessitated an increase of charges, an increase, no doubt, originally suggested by the competition for the accomodation that the railroads could afford. The increase was not minded by merchants as long as they could sell the same amount of goods as before, but it was felt by purchasers in enhanced values of the goods required. The purchasers, mainly producers of breadstuffs—that is, the farmers of the West—were at the same time charged more for the transport of their produce to market, or rather purchasers of that produce were, and they deducted it from the price they paid the former. The universality of stock-watering and of increase of rates of transportation at length roused the agriculturalists to action—hence the formation of Granges, and the founding of a party to regulate freights and fares by legislative action. The founders of it say that their constituents were year by year more remorselessly ground by railroad magnates; that patience had ceased to be a virtue, and that they were determined to have, as nearly as possible, the value which their produce, minus the merchant's profit, would have in foreign markets. So far the farmers. The merchants were not roused to action until those of the great commercial center of the Union—New York—found their city threatened with the growth of rivals who would drive away from it the trade of the Western States. The splendid water-way to the sea afforded by the Lawrence and the Great Lakes, and the series of great and flourishing cities with which that water-way is studded—Milwaukee, Chicago, Detroit, Montreal, Quebec, etc.—have suggested to the merchants of Canada the feasibility of securing the trade of the great West. Water carriage down the St. Lawrence and to Europe can be done a great deal cheaper than by rail at the present rates charged by the railroad companies, and the city of Montreal is preparing for the turning of the trade its way, by the construction of immense stone docks at that city. Then it is proposed to cut a canal from the Ohio to the James River, thus creating a new water from the Atlantic to the Mississippi and its tributaries, and going to build up Norfolk, Virginia, to the status of a great commercial city. The New York merchants have taken fright at this, and some have started on the war-path after the railroads with as much eagerness as the farmers themselves. The Board of Trade in session has resolved that Congress be requested to exercise the power with which it is vested to regulate commerce between States and Territories, to finally settle the question of cheap transportation. And now that the question has been raised, it will not cease agitating the country until a radical change in the whole public railroad policy has been effected, and until, probably, it has given birth to a political revolution. On the Pacific Coast here, cheap transportation has a two-fold aspect—one a railroad one, the other a shipping one. We want cheap transportation on land to enable our merchants not only to reach the most distant part of the Pacific Coast with their goods, but to enable us to compete with the East for our rightful share of the trade of the Mississippi Valley and thus enable us to sell the teas of China and Japan, the sugars of China, Batavia, Central America, Manilla, the Sandwich Islands and Peru, and the coffees of Ceylon, Central America, Java and Manilla to all the people, at least, west of the Mississippi and north of the Red River of Louisiana. We want cheap transportation by sea to give our agriculturalists a living profit on the products of their farms, and to keep the money obtained for our crops here instead of paying it to ship-owners who live from six to ten thousand miles away. And the selfish interests of the railroads really lie in according, of themselves, cheap transportation. It does not require much argument to show that a low rate with a great deal of business is much better than a high one with little or no business, and that high rates frequently render it unprofitable to deal in goods that have to be transported to market by rail. No particular stress should tempt managers into trying to raise funds in this way, for the result is too evidently disastrous. The merchant makes the experiment, and through high rates of transportation, not being enabled to make a living profit, gets discouraged and seeks some city more favorable for business, or enters on a career of opposition to the railroad, involving the building of competing lines, or, as has been the case, invoking Congressional or State legislation to his aid. We have spoken of the general question—the local question reduces itself to cheap goods-freights to all points to the Eastward, and cheap sea freights to the ports of Great Britain and Ireland.

A New Australian Steam Line.—A new line of steamers to Australia will be probably inaugurated before the end of the year. Mr. Hall, United States Consul at Sydney, who has for many years tried to establish such a line, is the promoter of the enterprise. The first steamer is to leave Sydney for this port on the 16th of December. It is intended that two others will be subsequently laid on. They will touch at Kandava, Fiji, and at Honolulu, and will, it is thought, be connected by a branch line with Auckland, New Zealand. J. C. Merrill & Co., of this city, are named as the probable San Francisco agents of the line.

The project of piping oil from the oil region to the sea-board seems to be seriously entertained, and we understand that a company has been, or is being, formed for that purpose. It is proposed to lay two lines of pipe—one of six inches for refined and one of eight inches for crude—using a large engine at each end, one for force and the other for suction. This would be literally pumping oil, say from Titusville to Philadelphia, and the pipes would therefore be the longest pump-stocks in the world.

Barley to Liverpool.—The ships "St. John" and "British King" were cleared last month for Liverpool with cargoes of 1,700 and 2,000 tons of barley. These were the first cargoes ever shipped thither from the Pacific Coast, and there is every prospect that they will be the foundation of a trade only next in importance to that in wheat. England imports every year immense quantities of barley for beer manufacturing purposes.

The following statistics of the leather trade of Pennsylvania are of interest: There are 800 tanneries, 294 engines and 134 water powers. The bark used yearly amounts to 322,110 cords, costing $3,369,587; the skins and sides tanned annually are 893,000 of the former and 1,617,620 of the latter. The hides tanned are 1,808,760. The capital employed represents $1,800,000; the material used, $13,994,000; the products amount in value to $19,828,320, and the wages to $1,684,790.

Silk Manufacture in the United States.—From a mere experiment, but a few years ago, silk manufacture in the United States has assumed really vast proportions, and promises to become one of the leading pursuits of the country. According to the lately issued report of the silk manufacturers' association of America, it appears that $30,000,000 is the amount of capital invested. Sixteen thousand operatives are employed, who earn about $8,000,000 wages, and the product of whose labor amounts annually between $30,000,000 and $40,000,000.

England is announced to be the only civilized country in the world which has not sent home-grown tobacco to the Vienna Exhibition. Varieties are shown from Norway and Sweden, as well as from the tropics and from all intermediate territories. It is remarked that the value varies throughout very much according to the distance from the equator, thus while the unmanufactured leaf from Havana is valued at 10s. a pound, that from Holland is priced at no more than £4 a hundredweight.

The Mineral King Mines.

A correspondent of the Visalia *Delta*, writes as follows concerning the new mines in Tulare county: The first object we noticed worthy of newspaper comment, after reaching the foothills, was a salt spring, situated on the south bank of the Kaweah river, about five miles above the mouth of the South Fork. The spring rises from a dyke of rotten trap rock, the subjacent formation being feldspathic granite. Three miles further on we reach the mouth of Marble Fork (or Upper south Fork). After crossing this stream the trail becomes more abrupt, and to avoid jimsel and other undergrowth, follows the pine belt over hills and hollows—a very tedious trail. At one point the trail is shoved down the hill a mile by the abrupt intervening of a mountain of white marble. Unlike most of our mountain streams, Marble Fork is not closely cañoned at any point, and offers a very favorable route for a road to reach the summit of the Sierras.

The mines are situated one point north of east from Visalia, distant about fifty miles, and just to the southwest of the highest peak discernable from the valley. This peak may be known by its presentiug two thousand feet of perpendicular face to the north; and is called by some the Half Tater Hill. As to whether that is the proper name we leave Clarence King and Prof. Whitney to determine. I believe it to be the highest peak of the range so far as known. The mining region is a belt of stratified and transition rocks, such as white marble, black slate, horn stone, gneiss, and a very peculiar formation of bright green color with component parts, somewhat resembling syenite. Between these different formations there is, in almost every case, a deposit of metaliferous ore, containing iron, copper, antimony, arsenic, etc., and all supposed to carry more or less silver. So far as known, no assay has been obtained, showing a first-class silver ore, but on the other hand we believe that the miners have made the mistake of selecting none but lead ores for assay. There is more metal here visible, upon the surface than we have ever before seen in the same extent of territory.

If high-flown titles will secure it, these leads are bound to pay. We have the White Chief, the Silver King, the Monarch, the Dolly Varden and the Lady Franklin. Then comes a score or so less pretentious, as the Black Wolf, the White Fox, the Lady Alice, the Big Jim, the Blue Grouse, the Salt Grass, etc. A singular thing about this discovery is that the discoverer claims to have been led here by the friendly spirit of a dead Indian. What is perhaps more singular still, he is said to be a man who on all subjects other than spiritualism and mining appears sober, candid and sane.

Another correspondent of the same paper writes on the same subject as follows:—I have been watching clearly for a truthful and detailed account of the new mines of Tulare county, but as yet have not seen it. The extent of territory, as I have seen it, in which rich minerals abound, is about 16 or 20 miles in length north and south, by 7 or 8 miles in width east and west. This territory is of a primitive formation, the surface-rock being slate, with strata or ledges of granulated lime rock and quartz, running the entire length of said territory in a direction of about 10 degrees west of north and east of south, said ledges, nearly all, loded with mineral deposits, and very many of them of unprecedented richness and magnitude. The largest of these lodes yet discovered is that known as the White Chief lode, the next in breadth and value are the Lady Franklin, Monarch, Black Wolf and the Cliff lodes. Already have there been one hundred and fifty thousand linear feet of mineral bearing veins located, and from fifteen to twenty assays made, nearly all of which have exceeded expectations. A certificate of assaya is before me from the Black Wolf, which is as follows: Copper, 37.5 per cent.; Gold, $12.54 per ton; Silver, $442.96. Total, without copper, $455.50. Ore from the White Chief, from the surface, assays $54.55 silver, and 7½ per cent. of lead; the ore vein in said lode being about 24 or 26 feet in thickness; this mineral bearing territory is situated on the head waters of Little Kern river and the Middle Kaweah creek, and is as yet almost wholly unprospected, and bids fair to outrival any mining location in this State or Nevada. There is room yet in the district for the location of at least one thousand claims; and I believe from what I have learned from a stay of two months in the mines, that fully that number will be located during the coming summer. As yet there have been but few, if any claims located, except the ore vein made its appearance above the surface of the bloom rock. The local laws of the district are, we think, well calculated to insure the rights belonging to the prospector. The Recorder of the district has exerted himself manfully to have all claims so located that shooting-matches and law-suits shall be few; and we think it in all respects a sound, healthy mining organization. A wagon road from N. P. Dillon's saw-mill will unqueationably be completed to the mines within the next twelve months.

New Discoveries of Quicksilver.

The most important quicksilver district in the world will yet be that within the limits of California. New discoveries are now of almost monthly occurrence. Up to this time nearly all the important discoveries have been confined to the Coast Range. The northern half of Napa county and the southern half of Lake county are known to be rich in quicksilver, and there is great activity just now in that region, both in prospecting and in developing new mines.

The *Territorial Enterprise* gives an account of an excursion recently made by John P. Winters and Lew Goodwin, of Virginia City, to the southern part of California, to find a new quicksilver lode, the existence of which had been secretly known for some time:

They were eminently successful in their search, not only finding the mine, but finding their most sanguine anticipations far exceeded by the reality. Leaving San Francisco, they took a branch of the Southern Pacific Railroad to Soledad, thence took a team 145 miles south to San Luis Obispo, and from that place to their mine. They had with them the original discoverer of the mine, and therefore had no trouble in finding it. The discoverer is a man who has had considerable experience in mining and prospecting for quicksilver, and has discovered three or four mines besides the one of which we are now speaking. This one he discovered about ten years ago, since which time he has occasionally visited it to see that it was all right, but never remained to do any work on it. The croppings are described as being immense, and nearly all the boulders and float rock about the lead show streaks of cinnabar upon being broken open. The party located under the new law of Congress, and, we presume, gobbled up all they could find. They set a party of men at work to develop their lead, which they believe to be the "old king bee" of all quicksilver leads.

Extensions.—Since the first discovery of silver bearing leads in the State it has been customary to locate an unlimited number of extensions on claims supposed to be valuable. In accordance with this long established custom, some of the "smart ones" who are everlastingly locating extensions on "big things," went after the Millionaire with a rush and coyoted on the hill side where it was supposed to run, beyond the lines of the original location. While one party was engaged in digging, in hopes of striking the ledge, another party went to the District Recorder and filed a notice with that officer, claiming the ground upon which the other was at work. The working party, ascertaining this fact, proposed to compromise with the "notice" fellows and succeeded in doing so, but work was abandoned the moment it was effected. Prospectors should bear in mind that the Congressional mining law expressly prohibits the location of claims upon the mere supposition that they contain a mineral bearing vein. The law now is that to hold a ledge you have first got to find it. Until this is done anybody and everybody has a right to look for it and the finder will hold it regardless of notices filed with the District Recorder. The language of the law is: "No location of any mining claim or ledge shall be made until the discovery of the vein or lode within the limits of the claim located."—*Silver State.*

Ship Property at New York.—The following sales of ship property occurred in New York during the latter part of September:

Name.	Tons.	Built.	Metalen.	Prices.
Sandford	1,159	1869	1871	$60,000
Richard Busteed	862	1857	1870	23,000
Xenia	786	1870	1872	21,600
Cairo	369	1868	1870	16,500
Ada Carter	435	1862	1872	15,000
Pleiades	330	1850	(not metsled)	5,000
Salinas	150	1863	1870	6,900

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 28 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address DEWEY & CO.,

PUBLISHERS, PATENT AGENTS AND ENGRAVERS,

No. 338 Montgomery street, S. F.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS.
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgist's Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10 (in coin); in leather, $12. Forwarded by mail, in cloth, $11.40, currency; in leather, $13.75. Issued and for sale by DEWEY & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

MONTGOMERY'S HOTEL,

227 and 229 Second street, ... SAN FRANCISCO.

This Hotel has been newly furnished, and is situated in a central and healthy location, and is one of the few Hotels in San Francisco conducted on Temperance Principles.

BOARD, PER WEEK, $3.50. BOARD AND LODGING, $4 TO $5. SIX MEAL TICKETS FOR $1.

CHAS. MONTGOMERY, Proprietor.

☞ Passengers and Baggage taken to the Hotel free. ☜

Monopolies and the People.

The above is the title of an octavo volume of some 500 pages, recently published at Davenport, Iowa, by Day & Egbert, from the pen of Hon. D. C. Cloud, a prominent citizen of Iowa. Its publication is timely, and its perusal will be found both interesting and profitable, especially at the present time. The work is dedicated to the "Patrons of Husbandry," and is doubtless intended and in fact does very fairly and fully represent and show forth the grounds on which that great movement is based.

The author has taken hold of the work with holdness and earnestness, and manifests a thorough acquaintance with all its details. He appears to have no partisan bias in the matter, but draws aside the veil, and presents a series of stubborn facts which are allowed to speak for themselves, regardless of who may be hit or hurt. He writes as though he really believes all he utters, and as if in the performance of a duty in the presence of serious danger. He holds that there is a power in the land possessing and exercising elements destructive not only to our great industrial and producing interests, but also to the very form and spirit of our government. Thus believing and uttering, the author endeavors to suggest such measures of relief and protection as he thinks are within reach of the people, and which he believes will save the country from the threatened crisis.

It is certainly a fact which must be admitted by every intelligent and candid thinker, that we, as a people, have reached a point where corporate monopolies, rings and individual speculators have by united and persistent effort obtained such a control over the government, and moneyed and industrial interests of the country as to seriously threaten the general welfare and prosperity of the people. The men who have thus combined do not belong to any one political party, or any particular moneyed class; they are found everywhere, and appear to be strongly united in the purpose of grasping and holding every branch of government and industry, and controlling the same for the benefit of capital, allowing only just so much to go to the producing and industrial classes, as shall barely suffice to keep them from utter financial ruin. While we have no titled aristocracy in this country, there is no mistaking the fact that the tendency of these movements is to foster and build up among us a moneyed aristocracy of wealth, more despotic and more antagonistic to the great industries of the land than any which exists among the nations of the old world.

A silent or passive acquiescence in, and submission to such a condition of things cannot be conceded by the people. These evils must be corrected, and the rights of the people restored, be the struggle ever so long or so hard. Special legislation; taxing the people for the purpose of aiding private enterprises; giving away public lands and public moneys to make the rich richer; malfeasance in office and public corruption in general must be checked at all hazards and at any necessary cost. The antiquated idea that the government was instituted by the people and for the people, as a mass, and not for the few, must be once more revived and insisted upon.

In no country are the people themselves more directly interested, or invested with more power to bring about such reforms than in these United States. Hence it follows that all should seek to thoroughly understand the true condition of the country, and the character and necessity of such measures as are proposed for its prosperity or reform. It is to this end that the work before us has been written, and most appropriately has it been dedicated to that growing Order which has handed together to resist the wrongs which we have contemplated, and give relief and safety to all the great industrial interests of the land.

The book contains just that class of facts, clearly and concisely stated, upon which the people should be correctly informed, and without a knowledge of which we cannot hope for success in our efforts at reform. In its preparation the author has wisely abstained from any mere display of words; and while laying bare the most exciting stories of rascality and double dealing, and calling things always by their right names, he neither forgets himself, looses his temper, or descends to mere partisan tirades or subterfuge. The work appears to be receiving a very full and free endorsement from the people's press every where, and especially from that portion of the agricultural press which is laboring in the interest of the great movement to which it is dedicated. We hesitate not to say, that the book should be read by every one interested in the general welfare of our industrial classes in all sections of the Union.

We subjoin a portion of the topics discussed, from which our readers may form some idea of the character and scope of the work: A preliminary survey of the condition of the country; the railroad iniquities; how the monopolists help themselves; the oppressions practiced and unjust discriminations made by railroad companies in the transportation, shipping and storage of freights; how Congress has betrayed the people and become a stock exchange; how land grants "develop" a country; the Credit Mobilier and other villainous contracts; has Congress the constitutional power to create and endow private corporations; the sole purpose of taxation; the fatal consequences of mortgaging cities and counties for the construction of railroads; our impoverishing transportation system, and the ware-house conspiracy; false hydraulics—watering stocks—its unlawful profits the source of extortionate tariffs; monopolists made a privileged class, by being relieved of taxation—an outrage upon the people; the strong grasp of consolidated capital on our legislation; the "trail of the serpent" in the Interior Department; the monopolists at the White House; how Wall Street builds railroads—a hot bed of corruption; the U. S. Supreme Bench invaded—its decisions reviewed; our banking system—its wrongs and unjust taxation of the people; reformation or revolution; a return to the policy of the Fathers; conclusions of the author.

The concluding chapter embraces over one hundred and fifty pages, and forms, perhaps, the most valuable portion of the book. Mr. Allen Broomhall, of Muscatine, Iowa, is, we believe, the present proprietor of the work. We do not know that it is for sale on this coast, but it certainly should be. The copy before us was received by mail from Mr. Broomhall, with whom we shall communicate, and suggest that the book be placed for sale in this city. Our readers will be notified of the result of such correspondence.

Little Cottonwood Mines.

A correspondent of the Salt Lake *Tribune*, writing from Alta City, Little Cottonwood, under date of October 21st, says that the shipments of ores from the different mines have not been as large for the present week as in former times; the decrease is not on account of the scarcity of ore, but from the cause of the stringency of the money market in Salt Lake City. I have been informed by some of the owners of mines that the ores have previously shipped are still on their hands either at Sandy or Salt Lake, having been unable to sell them. It was supposed, however, that the financial crisis would not have any material effect upon Utah and its mining camps, but it has so far affected them seriously, as far as the sale of ores and bullion is concerned. The miners have all continued to prosecute their developments, and are working their usual forces, resulting in new strikes being made almost daily.

The Emma Mine

Shipped about eighty tons last week. There is a rich strike in the bottom of this mine, but it is a good deal easier to find out if it is true by awaiting the arrival of the London *Mining World*, in about two weeks, than to ascertain the facts here. It is also reported that Mr. George Atwood, the general manager of the company, has, through his unusual zeal and energy, succeeded in getting the company out of debt during the time he has been in charge, and this will, no doubt, place the mine at the head of the dividend-paying mines of Utah, and which will be gratifying news to its stockholders in England. The concentrating and washing of the second-class dump has again been resumed since the weather has cleared up, they having been interrupted for a few days. The work will be prosecuted as long as the weather will permit it.

The Flagstaff.

Has shipped about sixty tons per day. The company will commence the erection of a new ore house, capable of holding 1,000 tons of ore, in the place of the one which was destroyed by fire about six weeks ago. The work in the mine is constantly pushed ahead under the able and efficient Superintendent, Capt. Goldsworth, who is untiring in his efforts to make the mine a paying piece of property. Rumor has it that there will be a change in the general management of this mine.

The Oxford and Geneva

Again resumed the shipment of ore, and will ship about five tons daily. The force employed at the mine are chiefly employed timbering the main incline and the lower works; until that is thoroughly completed and the supply of timber, coal, etc., has been housed for the winter, no ore will be hoisted. It is the intention of the company to sink the main incline 200 feet deeper before running more levels. This will consume a great portion of the winter, and sufficient ore will be taken from the proposed shaft and levels to have a large accumulation of ore when the spring opens. The same company have lately acquired another very promising piece of property on Peruvian Hill, known as the Harvest Home, which has been developing for the last two months, with flattering results, the ore being carbonate in its nature and the vein very large in its croppings.

Victoria and Imperial

Tunnel and Mining Company. The tunnel is being pushed ahead on a contract, and is in about 580 feet. The incline on the ledge is on a body of very fine ore, and it is expected the shipment thereof will commence next month. A large ore house has been built and a full supply of timbers, wood, etc., laid in for the winter. This mine will soon rank among the leading claims of Little Cottonwood, under its present Superintendent, Mr. S. W. Blakely.

The Toledo Utah Mining and Smelting Company's Works.

Are pushing work ahead in their several mines. The shaft is down 237 feet, with a solid body of ore 2½ feet in width, on the bottom, and an average of one foot west. On the fifty-foot level they are drifting west on a 2½ foot body of very rich ore, which has lately been found. The company are making their usual daily shipments of ore.

Meetings and Elections.

GREAT WESTERN QUICKSILVER M. Co.—Nov. 14. Directors—E. Green, A. W. Bowman, E. V. Joice, P. H. Kraner and R. E. Breuster.

ST. PATRICK G. M. Co.—Oct. 30 Trustees—J. W. Gashwiler, Jno. F. Boyd, J. F. Lightner, David Fay and Robert Sherwood.

A NEW AUSTRALIAN STEAM LINE.—A new line of steamers to Australia will be probably inaugursted before the end of the year. Mr. Hall, United States Consul at Sydney, who has for many years tried to establish such a line, is the promoter of the enterprise. The first steamer is to leave Sydney for this port on the 16th of December. It is intended that two others will be subsequently laid on. They will touch at Kandava, Fiji, and at Honolulu, and will, it is thought, be connected by a branch line with Auckland, New Zealand. J. C. Merrill & Co., of this city, are named as the probable San Francisco agents of the line.

AN ACCIDENT occurred on the 25th ult. on Ruby Hill, by which one man was killed and two injured. Carelessness in blasting the cause as usual.

THE past four weeks' run of the Empire (Grass Valley) was about $18,000 worth of gold.

THE smelters are again in active operation at Little Cottonwood, Utah.

A re-union of California "Forty Niners" is talked of at Carlinville, Illinois.

The Most Popular Medicine Extant.

1840. Over 30 Years, 1873.

SINCE THE INTRODUCTION OF

PERRY DAVIS'

PAIN-KILLER,

And after thirty years' trial, the "PAIN-KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and none where it has not been largely and highly prized. Moreover, there is no climate to which it has not proved itself to be well adapted for the cure of considerable variety of diseases; it is admirably suited for every race. It has lost none of its good name by repeated trials, but continues to occupy a prominent position in every medicine chest; and is still receiving the most unqualified testimonials to its virtues from persons of the highest character and responsibility. Physicians of the first respectability recommend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, etc., but for Dysentery or Cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine. No article ever attained such unbounded popularity. As an external and internal medicine the Pain-Killer stands unrivalled.

Thirty Years are certainly a long enough time to prove the efficiency of any medicine, and that the PAIN-KILLER is deserving of all its proprietors claim for it, is amply proved by the unparalleled popularity it has attained. It is a SURE and EFFECTIVE remedy. It is sold in almost every country in the world, and is becoming more and more popular every year. Its healing properties have been fully tested, all over the world, and it needs only to be known to be prized. Be sure you buy none but the genuine, manufactured by PERRY DAVIS & SON, Providence, R. I.

Sold by all Druggists. nov8

CHOLERA AND PAIN-KILLER.—The efficacy of Perry Davis' world-renowned Pain-Killer in all diseases of the bowels, even in that terrible scourge, the Asiatic cholera, has been amply attested by the most convincing authority. Missionaries in China and India have written home in commendation of this remedy in terms that should carry conviction to the most skeptical, while its popularity in communities nearer home is ample proof that the virtues claimed for it are real and tangible. The Pain-Killer has been before the public over THIRTY YEARS, and has won a deservedly high reputation as an alleviator of pain and a preserver of health. It has become a household remedy, from the fact that it gives immediate and permanent relief. It is a purely vegetable preparation made from the best and purest materials, safe to keep and to use in every family. It is recommended by physicians and persons of all classes, and to-day, after a public trial of over thirty years—the average life of man—it stands unrivalled and unexcelled, spreading its usefulness over the wide world. Its large and increasing sale affords positive evidence of its enduring fame. *

ASSIST NATURE IN HER EFFORTS to shake off a cough or cold, or she may revenge herself by giving up the contest. Remember that with *Hale's Honey of Horehound and Tar* for an ally, she will extinguish the worst cough in a few days. Crittenden's, 7 6th Avenue. Sold by all Druggists.

Pike's Toothache Drops cure in 1 minute. *

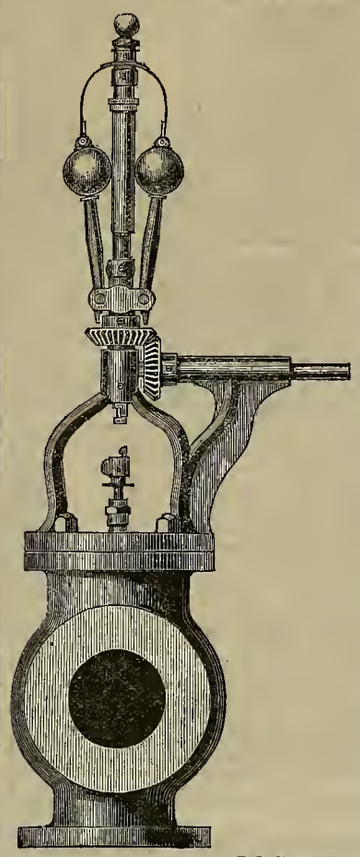
HENDY'S

IMPROVED STEAM ENGINE REGULATOR.

OVER 400 HAVE BEEN PUT IN USE.



RECOMMENDATION.

ST. PATRICK MILL, Placer Co., Feb. 10, 1873.

JOSHUA HENDY, ESQ., SAN FRANCISCO:

Dear Sir: We, the undersigned, take pleasure in giving you the following testimonial as to the merits of the Hendy Governor, which we ordered from you about four months ago. Though more than pleased with its workings at first, we deferred writing until we had tested it thoroughly.

Our engine is 12x36 (carrying 70 lbs. of steam), driving 15 stamps, 725 lbs. each; 1 Wheeler Pan, 1 Knox Pan, 6 Hendy Concentrators. The discarded Governor was the common "Arm and Ball Governor;" it giving but poor satisfaction, we decided to try the "HENDY," and are pleased to report in its favor for the following reasons:

1st. IT SAVES US FUEL. Previous to attaching your Governor we were burning 3¼ cords of wood per 24 hours. We now consume but 2½ cords doing the same work.

2d. FOR SAFETY. The "trip" saved us from an expensive smash up but a few days ago, during the temporary absence of our engineer. The Governor belt run off the Pulleys. Your little automatic trip worked like a charm, and but one or two revolutions was the result, and no damage. Had we been using any other Governor, the probability is that we would not have had a whole cam in the mill.

3d. IT IS A PERFECT GOVERNOR. We can turn off the Wheeler Pan and hang up one-third of our stamps, without any perceptible change in speed.

4th. THE ADJUSTMENT for regulating the speed without increasing or reducing the size of our Governor pulley, is admirable, and as easily managed as setting a clock.

5th. IT IS SIMPLE and not liable to get out of order, or requiring more than ordinary care.

Yours respectfully,

JAS. H. OROSSMAN, Supt.
GEO. H. BARNEY, Chief Eng'r.

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rico's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

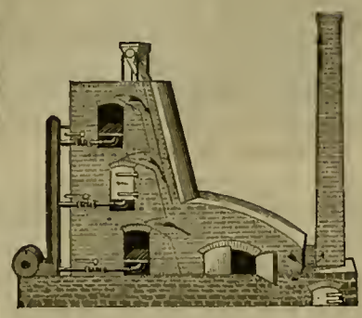
Metallurgy and Ores.

EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the Inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street,

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.

GENERAL MERCHANDISE.

WEDNESDAY NOON, Nov. 5, 1873.

There has been considerable activity in prices, and sales of California Mustard, now coming in, have been large. Bags are quiet, with no anticipation of a rise, as the excessive stocks on hand cannot possibly be exhausted this year. Holders have made up their minds to the necessity of carrying their stocks over till next season. The buoyant tendency of Syrups continues, and quotations show a strong marke t.

San Francisco Metal Market.

WEDNESDAY, M., Nov. 5, 1873.

The exportation of American Iron to Great Britain, and the expected driving of English metal from the markets of North America, turn out to have been a little premature. There is no doubt that the shapes of Iron trade has changed, but the time has hardly come for a general export of American Iron. Still, the fact that cargoes have been sent to England, though trifling in amount, is not without significance, and is made a matter of grave consideration by English iron masters. Quicksilver has been sold in New York for $1.15 ℔ lb; is steady here. Our local metal market is quiet. Quotations are as follows:

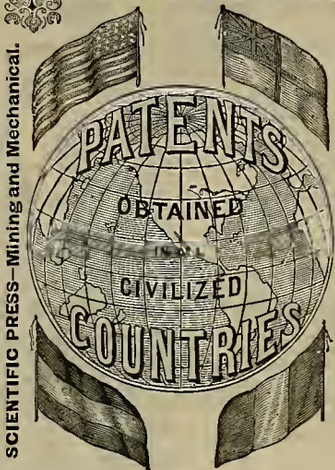
DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.



SCIENTIFIC PRESS—Mining and Mechanical. PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Single copies, 26 cts.

PLANTATION FARM FOR SALE.

TITLE—UNITED STATES AND STATE PATENTS, issued and upon record—embracing 431 92-100 acres of as fertile soil as there is in the or any other State in the Union, and has been demonstrated by actual cultivation to be most admirably adapted for the culture of Tobacco, Cotton, Alfalfa, Sweet Potatoes, Asparagus, Early Corn, Fruits, and every known species of early and late Garden Vegetables are produced from this soil in extravagant abundance. Four crops of Alfalfa, averaging nine tons to the acre, are cut each year. The fruits, in quality, size and abundance, are second to none in any country, and consist of 30 acres of vines of the choicest selections and varieties of Grapes, with an orchard, bearing profusely, early and late Apples, Pears, Peaches, Plums, Apricots, Figs, Prunes, Quinces, Cherries, and some tropical fruits. Two hundred acres of the plantation are under cultivation, as above indicated, and upon which all the improvements in buildings are located, which consist of a good House, Barn, Stables, Wine House and Cellar, Blacksmith and Tool Shop, and other buildings for tenants and laborers. Around and about the house are the very largest old Oaks, Lombardy Poplar and other species of Shade and Ornamental Trees, together with every variety of tropical and native Flowers and Shrubbery. The balance of the acreage has not yet been cleared for cultivation, having upon it a thick and heavy growth of timber, consisting of Poplar, Black Willow, Birch and Oak, which, when cut, will amount to some five hundred cords, commanding a positive cash value of four dollars per cord, cut and delivered at the Railroad Station—of which there are two, each within three miles of the land. The whole tract is substantially improved with fencing and a permanent levee, planted with large trees on the out and inside, with a wide driveway on the top, and forever forbidding any encroachments or inundation from the extreme highest of waters ever known. The river has a strong, permanent bridge, which is built to last all time. The improvements on the property alone have cost over $10,000, without any reference to the old and high state of cultivation the plantation is already brought to. This location was settled upon by the present occupant and owner on the 18th of October, 1846, making twenty-seven years and over, and he has never known sickness since his occupancy, and is now an aged man, which is his only motive for selling. Cash market for all products in the near towns and San Francisco. $10,000 a year, gross sales, are now realized from the various products of the plantation; double of that amount can easily be realized by more energy and additional cultivation. The property is reached by rail from San Francisco, to within three miles, and is located in Placer county, on the south banks of the Bear River, and will be sold on most favorable terms, both in the price for the property and terms of payments of same. Inquire at the Land and Loan Office, 313 Montgomery street, in person or by letter. S. P. WHITMAN.

NOTICE TO BUILDERS.

SEALED PROPOSALS, for furnishing certain materials and constructing a portion of the Napa State Asylum Building for the Insane, will be received at the office of the President of the Board, No. 204 Sutter street, San Francisco, until 12 o'clock M. of the 30th day of October, 1873.

The printed specifications and printed forms of proposals can be had on application to Messrs. Wright & Sanders, Architects, 416 California street, where plans and drawings can be seen and all further information obtained. No bids will be entertained unless made on the specified printed forms of proposals and accompanied with a certified check or bond with two or more good and sufficient sureties, in a sum equal to ten per cent. of the total sum of the tender, to be returned on the duo entering into the contract by the party to whom it may be awarded, or to be forfeited if the party fails to enter into the said contract.

The Board reserves the right to reject any or all bids.

oct4-td J. F. MORSE, President of the Board.

The time for receiving the above tenders is extended until 12 o'clock M. on THURSDAY, November 20th next.

J. F. MORSE, President.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.

IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah; Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.,—SIR: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully, W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

VOLUME XXVII. Number 20.

Fiedler's Condenser for Quicksilver Furnaces.

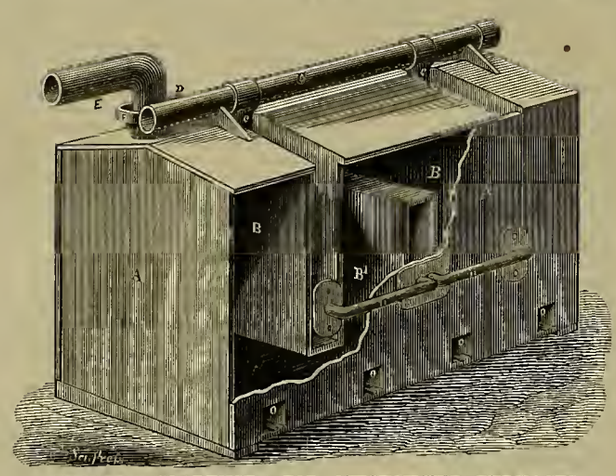
Ferdinand Fiedler, Foreman of the New Almaden mines, has recently invented an improved condenser and cooler to be used for condensing mercurial fumes, an engraving of which is shown on this page. *A* represents an ordinary tank such as is used to form one of a series of condensing tanks through which volatile fumes are drawn or forced in order to be reduced to a liquid state. This tank, *A*, is provided with a roof which slightly slopes each way from the middle line. A well is then formed near each end of the tank by cutting a transverse slot across the top and constructing a narrow box, *B*, *B*, inside of the tank which extends almost to the bottom; thus providing a double wall partition from the top to near the bottom as shown, the tops of the walls only being open.

Midway between these walls or partitions, is secured to the bottom of the tank a narrow box or compartment, *B'*, which extends nearly to the top of the tank, the boxes being arranged similar to the alternating partitions of an ordinary condensing tank. A curved pipe, *n*, outside of the tank on one side connects the bottom of the wells, *B*, *B*, with the box, *B'*. These partitions serve as water reservoirs to cool the fumes which are passed through the tank.

The fumes are introduced through the pipe, *E*, which communicates with the tank near one end through the top, between one of the wells, *B*, and the end of the tank. To render the joint formed by connecting this pipe with the top of the tank perfectly tight, so as to prevent the escape of any of the fumes, Mr. Fiedler constructs a water joint forming two vertical annular ledges around the opening into the top of the tank over which the pipe, *E*, is secured. The inside flange is slightly higher than the sides of the pan while the outer one is lower than the sides of the pan, and is placed at a short distance from the pipe so as to form a cup outside of it. When the pan has been once filled the water will stand in the cup and over the joint even when the pan itself is empty. The water is prevented from flowing into the tank through the opening covered by the pipe, by the higher inside flange. The end of the pipe, *E*, is fitted over the inside annular flanges so that the higher inside flange is inside of the pipe while the lower one is outside of it; the water thus covers the joint and prevents leakage.

A pipe, *C*, the under side of which is perforated with numerous fine holes, extends along the ridge of the roof of the tank, longitudinally with it. A branch pipe, c, leads from the pipe, *C*, into each of the wells, while another pipe, *D*, leads to the cup around the water joint. Water is admitted into the pipe, *C*, so that the branch pipes, c, c, will supply the wells and keep them filled; the pipe *D*, keeps the joint protected, while the perforations in the pipe, *C*, allow the water to fall in a spray upon the roof of the tank and run down the sides, thus providing a complete water covering over the tank and fresh water continually inside of it.

The fumes being admitted at one end of the tank through the pipe, *E*, are compelled to pass under and over the water partitions, being brought in contact with the cold sides of the tank and the partitions during their passage and are thus readily condensed, the mercury settling upon the inclined bottom of the tank from which it flows off through the ports, o, o, o, o. By this method of construction an arrangement is provided for keeping up a continuous circulation of cold water, both upon the outside and through the interior of the tank, so that whatever is contained in it is readily condensed and cooled. The water is allowed to flow from the central box partition, *B'*, through a hole (not shown) near the top of the partition on the opposite side of the tank, thus keeping the water in circulation. A number of these condensers are shortly to be put up at the New Almaden quicksilver mines.



FIEDLER'S CONDENSER FOR QUICKSILVER FURNACES.

Quicksilver.

Advices by the latest mail from Peru announce that the Government had resolved to put to public tender, the once-celebrated quicksilver mine of Santa Barbara, in the Department of Huancavelica. This mine formerly produced very large quantities of quicksilver. It caved in in 1850, and the supply from that source was temporarily cut off. Up to 1867 the mine is said to have produced upwards of $80,000,000 worth of quicksilver. The reasons given for its last abandonment were, distance from the seaboard, low grade of ores and scarcity of fuel, being unable from these causes to compete with the other great mines of the world.

The resumption of work on this mine has probably been brought about by the prevailing high price of quicksilver. They appear to have plenty of ore, but of low grade. The prices now prevailing for quicksilver would naturally stimulate production. It is now selling for £20 per flask in London, and $1.20 per pound in New York. Here it sells for $1.10 per pound. If the combination here could possibly be broken up, it would be a great benefit to the mining interests. It seems lamentable that an article which is so indispensable to our mining community should be subject to a speculative combination which raises the price above all reasonable figures.

There have been more new quicksilver mines —and good ones too—opened in California this year than ever before. Many of them are producing quicksilver, and prospecting is going on quite lively, as this sort of property is in demand. Still, with all this increase of mines, prices have continued to rise. The New Almaden production has decreased so much that the other mines do not make up the amount formerly produced by that. The Great Western mine gives promise of being a very valuable property and is even now turning out 60 or 70 flasks per month, with an increasing production. If there was a good healthy competition instead of a combination among the owners of the different California mines we would get the product at reasonable rates and they could still make a fine profit.

The Mining Commissioner's Report.

We received recently a volume entitled "Silver and Gold," published by J. B. Ford & Co., of New York. It consists of a reprint of the Report of the Mining Commissioner, R. W. Raymond, for the year ending December 31, 1871. It is neatly bound and is very probably printed from the plates from which the Government edition was printed, as the works are identical with the exception of the title. We gave an extended notice of the work when we secured advance sheets of the Government Edition, and now merely wish to speak of it in another connection.

Although the Report is marked 1873, it is in reality the report for the year ending Dec. 31, 1871. The manuscript was delivered to the Secretary of the Treasury in March, 1872, and, while a private edition is now published, the Government Edition is yet to be delivered. Some of our cotemporaries have been rather severe on the Mining Commissioner on this account, holding him responsible for the delay. They have also intimated that there is a "job" somewhere, because a private publishing house sends out its Edition before the Government does, and suggests that the matter merits Congressional attention. And it does merit Congressional attention in one respect at least. Why such an absurd delay should ensue between the date of sending in the manuscript and the publishing of the Report, is a question that the Secretary of the Treasury, the speaker of the House and the Government printer, only can answer. There has been clearly no neglect on the part of the Commissioner, since the material for the Report was ready shortly after the completion of the year for which the report was made; and it was transmitted to the Secretary of the Treasury nearly 20 months since.

Probably the Honorable Secretary has no "feet" in mine, and his friends are in the same fix. His mind is so engrossed with the questions of politics and greenbacks, that he does not care much about paying attention to the mines, since they produce only bullion, with which he has little to do. If we could stir up a greenback mine which would interest him, the Report might have been issued before this. Still, the Report is printed and ready for distribution, as an unbound advance sheet copy was received by Mr. W. A. Skidmore, Mr. Raymond's deputy, four or five months since. Either Messrs. Ford & Co. received extra sheets of the Report, or they used the stereotype belonging to the Government plates to print their edition.

We cannot see, however, that the Mining Commissioner has erred at all in the matter. He has no control over a single copy of his report. The books have all been printed and have been lying in Washington for some months, and the only reason they have not been distributed is that members of Congress will not pay the postage on them. Mr. Raymond, himself, finds difficulty in procuring as many volumes of his Report as he requires to send to persons who have written articles for it gratuitously. If the members of Congress did send the volumes to their constituents, precious few of them would come to this Coast, but would be distributed in the more thickly populated Eastern States where they are not of the slightest value.

As the Government Edition is very small, we can see no harm in the fact that a private firm has the enterprise to publish a reprint of the Report even if they do get extra sheets of the Government printer or use the Government plates. When the Government is stupid enough to delay the distribution of a valuable work like this for nearly two years, it is high time that private individuals take the matter in their own hands. If they make any money out of it they deserve it as, if their Edition was not to be had, there would not be more than a hundred copies on this whole coast. As the Secretary of the Treasury, Government officers, or printers have charge of the plates, and Mr. Raymond's control of the work is out of his hands as soon as the manuscript is delivered, we fail to see "corruption" in the affair. But even if he should use his influence to obtain the plates for private individuals, we maintain that he would do perfectly right, as a two years delay of his Report makes it comparatively valueless.

The whole method of printing and issuing the Report is a fine specimen of red tape and stupidity. The appropriation is small, the Report is always a year or two behind time, and the people who ought to have it do not get it. Agricultural Reports are printed monthly and annually and are up to date, while the book that would interest a very large mining population — all producers like the farmers, and valuable ones too—is used up at Washington because a few "Back Pay Grabbers" are too mean to pay postage on them. As far as we can see, however, the Mining Commissioner does his duty in the matter, and the blame lies at somebody else's door. If Messrs. Ford & Co. had also reprinted Clarence King's Report for instance, they would have merited the thanks of the community, for the book cannot now be procured, although it was published by the Government. His volume on mining is a valuable one, but is hardly to be had even for reference. We hope that these gentlemen will continue to reprint the Mining Commissioner's report, and that they will make some money out of it. The book is for sale by J. B. Ford & Co., 339 Kearny street, in this city, or the same firm, 27 Park Place, New York.

THE MINES near Baker city, Oregon, many of them have suspended work, owing to the extreme cold weather. The quartz mills at the Virtue mine, Gem city and Hogem are busy at work, however, and two new ones are being erected at Conner Creek and Rye Valley—both five stamps,

The High Sierra South of Mount Whitney.

At the last meeting of the California Academy of Sciences, Mr. W. A. Goodyear, of the Stste Geologicsl Survey, read the following "Notes on the High Sierra South of Mount Whitney," which will he of intereet to our readere:

The following observations relating to the region south of Mt. Whitney and traversed by the Hockett trail, between the Kern river and the eastern foot of the Sierra Nevada, were made during my trip with Mr. Belehaw into the mountains lsst July, when we climbed the supposed Mt. Whitney and discovered the mietake respecting it.

It is well known that at aboutthe head watere of Kiug's river, tho summit of the Sierra Nevada forks into

Two Great Ridges

Of nearly eqnal hight and grandeur, which then extend far southeast towards Walker's Paes, though gradnally diminishing in altitnde after paeeing the summits of Mt. Whitney and Kaweah Peak.

For a long dietauce the crests of these two idges vary from ten to fifteen miles apart, and are separated from each other by the tremendous cañon of the Kern River which lies betweeu.

The cnlminating points of the eastern ridge are the Kearsarge Mountain, Mt. Tyndall, Mt. Williamson, Mt. Whitney, the peak which has been mistaken for Mt. Whitney, and a few other unnamed peaks. Those of the weetern ridge are Mt. King, Mt. Gardiner, Mt. Brewer, Kaweah Peak, etc.

The Hockett trail crossee the summit of the eastern ridge at an altitude of probahly a little over 11,000 feet, at a point nearly opposite the center of Owen's Lake, and a few miles eouth-east of the peak which has been mistaken for Mt. Whitney.

We followed this trail to the locality known as Soda Springs, upon the main Kern River, which here flowe at an altitude of between 6,000 and 7,000 feet above the sea.

Throughout this eection of country, the mountains, so far as seen, consist entirely of granitic rock, with the exception of a single isolated and somewhat remarkable

Cluster of Volcanic Outbursts

At au altitude of about 9,000 feet above the sea. This cluster consists of four crater cones of moderate size resting on the granite, and one basaltic lava-flow of cousiderable magnitude. The first of these outburets seen in following the trail from Lone Pine ie some five or six miles east of the Kern River, and its altitnde is probably a little over 9,000 feet. It forms the whole western half of a hill some 300 or 400 feet high and reachee to its summit, while the whole eastern half of the eame hill is naked, solid granite. Thie ontbreak seems to be small and local, being apparently but a few hundred yards in extent in auy direction, its length north and south, however, being considerably greater than its breadth east and west. Its eituation on the hillside is peculiar. It appears as if a short fissure had opened here in a northerly and southerly direction along the western slope of this hill pretty well up towards ite summit, and just enough material been ejected through it to cover the whole weetern half of the hill, without however sufficient explosive force to scatter it much in any direction.

About a mile to the south of this hill are two

Twin Crater Cones

Which I did uot visit, etanding close together, and nearly equal in hight.

Following along the trail, we find at the distance of about a mile weeterly from the first hill mentioned above, another crater cone some 400 or 500 feet in hight, and perfect iu form except that a breach has been made in its north-east side, and deepened nearly to its baee.

From the immediate vicinity of the base of this cone,

A Lava Stream has Issued

And flowed for some fonr or five miles in a nearly true weet course, following the valley of a pre-existing creek to the main Kern River, where it now ends in a bluff faoing the river, bnt high above ite bed.

Appearances indicate that in this case the lava-stream issued first, and that after it had ceaeed to flow, the cinder cone was piled up over it at the point of ejection, the completion of the cone finishing the eruption.

The valley followed by the flow was rather broad, and the quantity of lava was large, filling the bottom of the valley, spreading out in places to half or three quarters of a mile in breadth and varying in depth from a few feet to two or three hundred feet at different points. The valley had a rapid fall towards the Kern River, and the bluff which now forms the end of the flow, is 1,500 feet or more below the poiut of iseue.

This eruption is of very recent geological age, far subsequent in date to the great volcanic period which covered the northern Sierra with such vast quantitiee of eruptive matter. For throughout the central counties of the State, this period was substantially closed before the excavation of the modern cañons began; while this eruption occurred very late in the history of the formation of these cañons. Yet, if we could determine the years that have passed, we should find it old enough as compared with the life of a man. For since it happened, the little stream whoee bed it followed has not only cut through it here and there, but near its mouth has eaten its way two or three hundred feet deeper thsn before into the solid granite under it. How fsr down the csñon of the Kern River iteelf the flow may have originsnlly extended, it ie impossible to tell, for the river, in deepening its own cañon, has here swept it all awsy.

For a considersble portion of the way where the bottom of the lavs is now exposed, it rests upon heavy massee of calcareous tufa previously deposited by mineral springe; and I noted as an interesting fact which I don't pretend to explsin, that at a point where I examined the tufa in immediate contact with the overlying solid lava, I could detect no physical change in it euch as might hsve been expected, from the heat to which it must have been exposed; but it appeared just like the same tufa in other places where the lava had not touched it. Neither shall I attempt to auewer the puzzling question, why this little clueter of volcanic outbreake ehould occnr away np here in the heart of the solid granite range 9,000 feet above the eea, and with nothing else volcanic eo far as I know within less than 30 or 40 milee of it in any direction. I ouly note the fact.

Another point of some intereet, is the fact that, though I looked and hnuted for them,

I Found no Glacial Scratches,

nor any other evidence of the former existence of glaciers anywhere in this portion of the mountains; not even on the peak, which has been mistaken for Mt. Whitney, and which is over 14,000 feet high; nor on the top or eides of another peak which I climbed in the western summit, four or five miles northweet of Soda Springe, and which cannot be much less than 12,000 feet high. Nor in the cañon of the Kern River, which I followed for four or five milee, nor anywhere where I went, did I find any traces of glaciere. This is certainly somewhat remarkable, when we consider the fact that the mountains only twenty miles to the north, though no higher than some of these, are, according to all accounts, full of glacial markings.

It is true that much of the granite in the region where I traveled is comparatively soft, and disintegrates rapidly from weathering. But this is by no means the case with all of it, and much of it ie as hard and as well adapted to preserve such workings as any in the Sierra. The fact therefore of their general, if not total absence from this region certainly means something. It does not, of course, prove that glaciers have never existed here, or that they may not have existed for a very long period of time. But it does argue that if they have, then, owing to some cause not yet explained, they disappeared from this region long before they did from the mountaine a few miles further north. The general character and appearance of that noblest portion of the Sierra, a few miles to the north of the peake I climbed, have been already described in the Geological Survey Report and elsewhere. But no words can convey an adequate idea of its wild and majeetic grandeur. It must be seen in order to be understood. I will only add that ite topography has never yet been worked up with anything like the accuracy of detail which is deeirable for California's sublimest peaks, and that it would be well if the Geological Survey had the means to send a party to spend the whole summer there to do it.

The Value of Gold and Silver.

Many people have a great desire to know the value of gold and silver in bulk, and to thie end we have secured the following from Prof. J. F. L. Schirmer, Superintendent of the Branch Mint in this city, and it may be relied upon as correct. The fineness of Colorado gold and the calculation of values on gold and silver are also given. It is a matter of considerable value, and it should be cut out and preserved:

One ton (2,000 pounds avoirdupois) of gold or silver, contains 29,163 troy ounces, and, therefore, the value of a ton of pure gold is $602,799.21, and of a ton of silver, $37,704.84.

A cubic foot of pure gold weighs 1,218.75 pounds avoirdupois; a cnbic foot of pnre silver weighs 656.25 pounds avoirdupois.

One million dollars gold coin weighe 3,685.8 pounds avoirdupois; $1,000,000 silver coin weighs 58,929.9 pounds avoirdupois.

If there is 1 per cent. of gold or silver in one ton of ore, it contains 291.63 ounces, troy, of either of these metals.

The average fineneee of the Colorado gold ie 781 in 1,000, and the natural alloy: gold 781, silver 209, copper 10; total 1,000.

The calcnlations at the Mint are made on the basis that 43 ounces of standard gold, or 900 fine (coin), are worth $800, and 11 ounces of silver, 900 fine (coin), are worth $12.80. —*Denver, Col., News.*

"A Mine What is a Mine."—During the past three or four weeke, Mr. A. C. Light, has taken from hie little ledge located on the mountain south of Indian Valley, something over $5,000. The best part of it is that he has pounded it ont with a hand mortar, and has plenty more of the same kind of rock left. Mr. Light has recently purchased the little ranch of Mr. Frank Fox, which was in the cañon below hie mine, and he will make arrangements to sluice off the ground under the ledge during the coming water seaeon. There ie no doubt that he has one of the best "little mines" in the country.—*Plumas National.*

Chemicals in Pan Amalgamation.

[Concluded from page 290.]

Before dismissing the subject of slimes and tailings, it is neceesary to refer to certain claeses of these ores which do not yield to the action of the snlphate of copper snd salt to the extent claimed in the foregoing pages. The preciee csuse of thie rebelliouenees has uever been accurstely ascertained, but from the fact that the bulliou produced in working them ie always of exceeding fineness (990-1000 and over) even when a large excess of sulphate of copper is ueed, it is evident that the evil consists in the presence of some subetance which decomposee the sulphste of copper, thns producing the same effect as if none were used. This injurious agent is probably sn alkali or alkaline earth. It is to be regretted that we have no knowledge of auy cheap chemical reagent producing practically the same effect as chloride of copper, aud which would not be eubject to this decomposition.

The following table will show to what extent the treatment of slimes is affected by the elimination of the copper-ealt. Five hundred and eixty-two and one-quarter tone of elime from Chollar ore were worked in charges of 2,500 pounds each, with 15 pounds sulphate of copper and 30 pounds ealt to the charge. Total amount worked, 562¼ tons.

	Gold.	Silver.	Total.
Value per ton	$ 12.60	$ 30.91	$ 43.51
Total values	7,084.35	17,379.14	24,463.49
Yield	1,651.16	6,200.93	7,852.66
Percentage extracted	23 30	35.68	32.97

	Gold.	Silver.	Total.
Fineness of bullion	16	980	996
	1000	1000	1000

Within half an hour of putting the sulphate of copper into the pan, chemical teets could not detect the presence of copper in solution in the pulp, thus proving that it had been almost immediately decomposed. The same phenomenon has presented iteelf in the working of tailings.

Such cases, however, are exceptioual, but prove why in certain instances the use of eulphate of copper and ealt may not produce the effecte claimed for them. Apart from these exceptional casee the beneficial effects of chloride of copper being thoroughly established, the question naturally arises why its use is principally limited to the working of slimes and tailings, and why it is not more generally employed in quartz-mills. There is not the slightest doubt that an intelligent use of chemicals would prove highly beneficial in many cases where the old method of treatment without chemicals is adhered to. The ores of the Comstock ledge are particularly docile under their influence. It is true that many mill-men claim to have inveetigated the matter, and have pronounced againet the use of chemicals, but, as has already been stated, their experiments were carried on in such an unfair manner that failure was inevitable. It could not be expected that a few ouncee, or even a few pounds, of sulphate of copper and salt would produce appreciable results upon a ton of ore, and yet millmen were deterred from using larger quantities through the fear of producing baser bullion. It is a common superetition that fine bullion is a guarantee of skillful amalgamation, than which nothing is less true. Until this prejudice is eradicated it is uselees to look for the employment of sulphate of copper in quartz-mille in quantities sufficient to eetablish its merits. Another cause of indifference on the part of Waehoe mill-men is the fact that they generally find no difficulty in returning by their preeent method of working 65 per cent. of the value of the ore, the amount uuniversally guaranteed by custom mills, and are, naturally enough, not disposed to increase the cost of working without corresponding benefit to themselves. The mine-owners also appear to be satisfied with these results, but their apparent indifference to their own interests does not admit of so simple an explanation.

The first quartz-mill to adopt the uee of eulphate of copper and salt, was that of the Meadow Valley Company, near Pioche, Nevada. This mill commenced operations in the summer of 1870. Owing to a misunderstanding only a small eupply of sulphate of copper was on hand at the time, and when this was exhausted the difference in percentage extracted wae immediately apparent. During the first week's run the yield was equal to 80 per cent. of the value of the ore. When the chemicale were exhaueted the yield fell below 40 per cent. only to recover on the receipt of a fresh supply of sulphate of copper. The following table will show the difference in percentage extracted while working with and without chemicals:

July and August, 1870—Percentage extracted, 54.40, working three-quarters of the time without chemicals.

September—64.39, working one-half the time without chemicals.

October—87.90, working with chemicals.

November—82.5, working with chemicals.

December—81.8, working with chemicale.

January—76.7, working with chemicals.

February—77.6, working with chemicals.

March—68, working with chemicals.

April—67, working with chemicals.

May—74.4, working with chemicals.

June—74, working with chemicals.

July—73, working with chemicals.

Average assay value of the ore for the year, $143.21.

The ores operated upon were very rich. In such cases the policy of working ores with chemicsle in preference to rossting msy be questioned. The matter must be decided by a csrefnl comparison of the expenss and reeulte of the respective methode. It muet furthermore be taken into coneiderstion that roasting involves dry crnshing, and consequently a decrease in the working capacity of a mill of a given number of stamps. This agsin uecessitstes a larger outlay for the erection of more mills in order to crush a sufficieut number of tons per diem to render possible the payment of any considersble amonnt in dividends. The expense of building furnaces, etc., mustaleo be tsken into consideration. Should, however, the ores prove of eo rebellious a nature that the difference in percentsge extracted by the roasting procese be sufficient to overrule these consideretione, then it ie evident thst the wet procees muet give way to dry-crushing aud roasting.

At the Nevada Butte Mill, where this method of working with chemicals was introdnced during the past enmmer, it was absolutely neceeesary to find some meane of reducing the ore without roasting, as it was not snfficiently rich to admit of the latter method of treatment. Here also it was found that whereas only 35 per cent. of the value could be extracted by quicksilver alone, the use of enlphate of copper and salt increased the value to 75 per cent. and upwards. These ores contained still more lead than those of the Meadow Valley mine, and finally became so base as practically to belong to the class of smelting ores, causing an enormous loes of quicksilver, aud rendering their beneficiation by the amalgamation procees an impoesibility. The enterprise had therefore to be abandoned.

The only chemicals thus far knowu to be applicable to the amalgamatiou process are salts of copper. A great benefit would be conferred upon the mining public by the discovery of other chemicals equally effective, but less expeneive, and not so subject to decompositiou by the iron of the pan or by the ore iteelf.

The Pardee School of Mines.

Tho new building, at Lafayette College, erected for the Scientific Department, uow occupied by the classes, was dedicated hy appropriate exercises, on Tuesday, Octoher 21st. This magnificent strncture cost over two hundred and fifty thousand dollars, and is the princely gift of Mr. Ario Pardee, the founder of the Scientifio Department of the college. It conaists of one entire building five stories in hight, fifty-three feet front and eighty-six feet deep, and two lateral wings, one on each side of the center building, measuring sixty-one feet in length and thirty-one in width; four storiee in hight, including a mansard roof, the whole terminating in two croee winge forty feet front and eighty-four feet deep, and four stories in hignt. The entire length of front, in a straight line, is two hundred and fifty-six feet. The material is the Trenton brown stone, with trimmings of light Ohio eandstone. It is heated throughout by eteam and lighted by gas. The firet floor is mainly devoted to the study of mining and metallurgy; the second contains the geological and mineralogical cabinete, a spscions auditorium, and smaller lecture rooms, reading rooms, and professors' studies. The third floor is devoted to the engineers. The right wing is occupied by the mining engineers. A large drawing room occnpies the lateral wing, while the cross wing embraces rooms for models and various profeseioual purposee. The left wing is occupied by tho civil engineers. The lateral wing compriees a drawing-room, and the cross wing is divided into roome for lectures, working models, collections, and the like. On the fourth floor the same ample provieion hae been made for the chemists. The center building is divided into two large rooms, one for technical collections, and the other an aseistsnt's room. The lateral wings are intended for qnantitative and qualitative analyeis. The cross wings at the extremity of the building are occupied by additional laboratories, lecture rooms snd profeseors' studies. The fifth floor of the center building is mainly occupied by laboratories for original researches. In determining what rooms were needed and the best arrangement of them, similar buildings in Europe as well as in this country, were carefully studied, and liberal provision has been made in all the departments of instrnction for every aid which has been devised for the most thorough and attractive teaching, and also for the prosecution of original reeearchee.

The formal dedication of such a noble building, equaled but by few college edifices in the country, was an event of the greatest interest not only to the Alnmni and friends of the College, but to all who are interested in educational matters, and of still more moment to capitalists who have inveeted or intended to invest their money in mines, furnaces, rolling mills, chemical works, machine shope, iron ship yards, or other fielde of prodnctive activity dependeut for success on the best training of minde of technical science.—*U. S. R. R. & Mining Journal.*

A Neat Method of Testing with Bunsen's Flame is as follows; A platinum wire ie bent into the loop or cage at one end, which is then dipped into powdered cream of tartar and placed in the flame. There remains a maes of charcoal and potassium carbonate. Thie is dipped into the subetance to be teeted and theu placed in the flame.

MECHANICAL PROGRESS.

Making Telescope Glasses.

In Professor Newcomb's article on the new telescope at Washington in *Scribner's* for November, occurs this account of the process employed by the manufacturers, Messrs. Alvin Clark & Sons, in grinding, polishing and perfecting the immense object glasses: The tools are very simple—round plates of cast iron, about three feet in diameter, hollowed out to suit the curves of the lens. They have somewhat the appearance of huge, shallow saucers, or more nearly still, of the shallow iron drinking cups attached to pumps or hydrants in some of our cities. Three of these tools were necessary, one nearly flat, for the inner surface of the flint glass, one convex, for its outer surface, and one concave, for the crown glass. The surface of the tool is covered with coarse emery and water, the glass is laid upon it, and the grinding is carried on by sliding the glass back and forth on the tool. While sliding, the glass is slowly turned round so that the grinding strokes occur successively in every direction on the glass, while, at the same time the operators continually move around in the other direction, so that the strokes are made successively in every direction on the tool. The result of these combined motions is that every inequality, either on the glass or the tool, is gradually worn away, and both are reduced to portions of nearly perfect spheres. When this result is attained, the grinding is continued with emery of continually greater degrees of fineness, until the surface becomes quite smooth.

The next operation is that of polishing. The whole tool is covered with a thin coating of pitch, which is pressed while still warm into the proper shape. It is then covered with a layer of water and the polishing rouge, and the glass is again laid upon it, and kept in motion in the same way as in the fine grinding. Thus each surface of the two glasses is speedily brought to a high polish.

The operations we have thus far described require no extraordinary skill on the part of the workman. With a little patience and practice almost any one can make himself a better glass than any known before the invention of the achromatic telescope. But, such a glass would by no means serve the purposes of astronomy now, and the chances of a glass of any size turning out exactly right on the first trial are very slight. The skill of the optician is now called into play to rectify the figure. Two formidable difficulties have to be overcome, to find what the defects of the glass are, and where they are situated, and then to remove them without introducing others. To find the defects, the glasses are put together, set up on edge, facing a luminous point at a distance equal to ten or fifteen times the focal length. The image of the point formed in the focus of the glass is then examined with an eye-piece of high power, or the eye is placed exactly in the focus, and the aspect of the glass noted as the light from the point passes through it. By these means the skilled optician can judge where the curves of the glasses are too great, and where too small.

The glasses are now taken back to the tool and the polishing process is recommenced, only pressing upon those parts of the glass where it has to be ground away. The glass is then tried again, and again returned to the polisher. The defects in a small glass can be thus polished away in a few days, but as the size is increased the process is more and more tedious, and the difficulties of judging what the defects are, and of handling the glass on the polisher so as to diminish them, increase enormously. It is in this tentative process of gradually working out every defect of figure, and even in compensating defects in the uniformity of the glass itself by a suitable change of figure, that the Clarks have exhibited their unrivaled skill.

Major Hoffman, of the government engineer corps, has invented a new sounding machine, which is now being used on the rapids at Davenport, above the bridge. It consists of six flat-boats, attached to a large boat in the center, which are towed to the place where soundings are to be made. They are joined together by a bridge, to which are attached ten poles, each twelve feet long, and placed eight feet apart. The soundings are made by the poles, which are driven down by steam. Immediately upon striking the bottom the poles spring up, again, and indicate by figures the depth of the water. These figures are taken down by a man in the office on the center boat. By this method sixty soundings can be taken in a moment, and all more accurate than by the old method.—*Am. Manufacturer.*

The bridge to be constructed over the Frith of Forth will be by far the largest in the world. According to the London *Builder* its hight will be 150 feet, and the number of spans nearly 100. The smaller span will be 150 feet wide, which is beyond the average width of the largest spans in ordinary bridges; but the crowning marvel of the whole structure is the great span in the center, which is to be 1,500 feet, or nearly one-third of a mile in width—an extent unparalleled in any existing structure of the kind. The entire cost of the bridge will be at least ten millions of dollars.

Steel vs. Iron.

One great objection to the more general employment of steel for purposes where much strain is to be endured, and where human life is to be risked, is, according to Mr. Robert Mallet, the lack of some reliable and ready means of testing the same. The very quality that chiefly recommends steel is the one most difficult to determine, and the most dangerous if absent. The strength of steel in plated structures as proportioned to iron, is usually rated something like 10 to 6.

One great source of imperfection in steel is the injuries which it is liable to sustain in the process of manufacture; when a bar or plate gets a hammer-blow while hot, or anything like a dent, or sustains any concussion which causes a sudden change of dimension, however minute, such bar or plate, in most cases, is certain to give way at the point of concussion on receiving a strain much less than would break the bar elsewhere. Anything, also, in the nature of a superficial injury to a plate, is much more serious in its effects on steel than on iron.

Steel as adapted for rails is said to show greater difference of good and evil than it does under any other conditions for use. A commission of fifteen railway engineers recently reported that the weight of evidence was in favor of employing steel instead of iron for rails in railway use; but especial stress was laid upon the necessity that existed for the excise of the most extreme care in the manufacture of the rails—especially in handling them while hot. Experience had shown that steel rails almost always break at the point where some injury had been received while the rail was hot. In most cases such rails break in a few weeks; while perfectly sound rails work without any perceptible wear or injury, for 12 or 15 years.

Steel is prone to be very much superior to iron when used for gearing; but it is proved that gearing mounted on timber framing is much more liable to fracture than when properly fitted on an iron frame. Wood, even when well secured, will warp and twist sufficiently to disarrange delicate machinery.

Close attention is being paid to the use of steel as far as adopted, with the view of its more general adaptation, according to the greater or less extent of success which may attend its present employment.

The Center-rail Railway.—A paper was read before the Mechanical Section of the British Association on the proposed center-rail of Mr. Thomae. The author stated that the projector of this railway utilised the principle by which the bicycle rider was enabled to progress steadily above two slender wheels. In the single rail system the wheels were placed in the center of the engine and carriages, and ran on a single line of rail; the wheels are double flanged and saddle the rail. The inventor did not trust the train to struggle into steadiness, like the bicycle rider, but provided balance rails for some distance in and out of stations. The engine and carriages would be provided with side wheels as balance weights, and which also came into action on the steadying rails at the stations. The advantages of this system were that the power might be brought to bear more directly and centrally on the driving wheel, and thus obviate one source of oscillation. Lighter engines and carriages were also practicable. In the discussion which followed, a general opinion was expressed of the impracticability of this scheme.

New Material for Making Paper. — An English journal is informed that it is intended to carry out in that country, in an extensive way, the French invention of making paper from the sheath of the hop stock, when the outer skin has been removed. The substance made from this material is of great suppleness and delicacy, and by its employment in this manufacture a new and considerable source of profit will be opened for the hop-grower. The importance of this discovery to Kentish farmers cannot well be exaggerated, for if the season should not prove favorable, and should fail to produce first-rate hops, the paper making material will compensate for the deficiency in this respect. No doubt the growth of hops will be introduced in future into many districts where they are not known at present, as the large amount of material which they will supply for paper-making will alone insure a good return for their cultivation. The price of the article is very high at present.

Ditching by Steam Power.—In North Germany the reclamation of the extensive low lands, that have heretofore remained uncultivated for lack of drainage, is now proceeding with vigor under the auspices of a company employing a large capital and effective steam ditching machines. Each machine cuts a canal 20 feet wide and 6 feet deep, and from 100 to 120 feet in length, every 10 hours. The peat is delivered on the surface of the ground alongside the canal, where it is dried, cut into bricks, sent to market. It is an excellent fuel. In Holland and Friesland there are 1,000 square miles of this bog land now worthless, which will be rendered habitable and profitable as fast as the canals are cut, to say nothing of the immense quantities of fuel that will be obtained by the ditching operation. —*Scientific American.*

SCIENTIFIC PROGRESS.

Is Hydrogen a Compound Body?

An item has found its way into many of the papers, stating that hydrogen has been resolved into two distinct gases by a French chemist. The story is that M. Leharre, chemist of the silk works of Foedre Brothers, Lyons, succeeded, after a series of experiments, suggested by the investigations of Professor Graham, of the British mint, into the properties of hydrogen, in resolving that gas, hitherto supposed to be a simple element, into two gases. One of these was absorbed in combustion of palladium in vacuo, leaving a gas that would no longer burn but, like nitrogen, extinguished flame, and had no color, taste or odor. Its levity is so great that when collected in a hollow copper globe about eighteen inches in diameter and the twelfth of an inch thick, it carried the globe rapidly to the dome of the Paris Academy of Science building. M. Leharre calls the new gas "abaron." It has about nine times the elevating power of pure hydrogen, and about twenty-five times that of ordinary illuminating gas, and can be prepared on a large scale at about double the cost of pure hydrogen. With its use balloons can be made of thin sheet iron, and leakages thus effectually prevented. The discovery is of the utmost consequence on scientific grounds, as it suggests the possibility of other supposed "elements" being complex instead of simple, and that our present ideas of elementary principles may be as erroneous as those of the primers of our childhood's study, where "the four elements" were set down as "earth, air, fire and water." M. Leharre's paper is said to have been read before the Paris Academy of Science, June 30th, in secret session, and its publication postponed until further investigation is made.

This is a brief account of the reported discovery. In tracing the history of the item referred to, we find that the information was first given in a letter from an American in Paris to the *Turf, Field and Farm.* As the fact has not been officially announced, we are disposed to accept it *cum grano.* So many startling discoveries are being daily reported, however, that this, though jarring harshly upon accepted chemical dogmas, is not as surprising as others announced within a few years. Yet, if verified, this discovery will necessitate large changes in text books.

New Process of Manufacturing Steel.—Bajault & Roche propose the following process, founded on the partial and intermolecular decarburation of cast-iron under the influence of oxide of iron in the state of rich ore. A mixture of cast-iron and of powdered ore, suitably run into metal moulds or forms, yields, on cooling, as many ingots uniting with the moulds. These ingots are then placed in a special furnace where they are kept for a certain time at a bright red heat. At this temperature and up to the end of the reduction numerous jets of carbonic oxide are seen, which escape and burn with a characteristic blue flame. Ingots of raw steel are thus obtained which only require to be melted either in crucibles or on the side of a reverberatory furnace. In this process the reactions are affected in the whole extent of a solid mass by an intimate mixture of the matters in contact, and these matters are not submitted to fusion till after their reciprocal transformation. The ore being then reduced, its action upon the sides of the melting apparatus is very trifling. The inventors thus evade the principal obstacle which has hitherto prevented the use of rich iron ores in the transformation of cast-iron into steel, in spite of the advantages which it was well known might be derived from such a mode of procedure. We may thus obtain every desired degree of carbonisation, the proportions of cast-iron and of oxide being capable of predetermination in a very exact manner. A sample submitted to the French Academy of Science gave the following analysis:—Carbon combined, 0·43; carbon, not combined, 0·08; silicon, 0·23; sulphur and phosphorus, 0 0. The steel was semi-hard, very malleable and tough, and acquired great hardness by tempering.

M. Marchand has been engaged in attempting to measure off chemical action produced by solar light. He has submitted to the sunlight a liquid containing equal parts of perchloride of iron and oxalic acid, and found that the reaction proceeds with great regularity in the disengagement of carbonic acid gas, which is proportional to the sum of the energy expended. This energy is such that for each cubic centimetre of gas produced, 0.001356 calories are evolved. This photometer is specially acted upon by the solar spectrum between F. and G., i. e. the blue rays. In an equinoxial day the average expense of this photo-chemical force on the 41st parallel of latitude is represented by 345 calories. He estimates it at the equator (at the same time) 479 calories, and at the pole 498 calories. The results of other experiments are given at length.

The Red Color of Lead-white.—The red color is said to be due to the presence of compounde of lead and oxygen, among which the peroxide was found in small quantity. Its origin is to be looked for in a lack of carbonic acid in the manufacturing process.

Cheap Sugar.—In the French world of industry and science another great sensation has been produced by an alleged discovery, the importance of which, if it turns out to be true, it is at present impossible to calculate, nor the effect it may have on the sugar trade of the future. It is asserted that the French engineer, M. Jonglet, has succeeded in making artificially beet-root sugar, which, however, is not real beet-sugar, but a composition or chemical sugar, if we may be allowed to use such a term. Already has the eminent M. Berthelot succeeded in making alcohol by a synthetic process; but the new discovery is of much more practical value, as it affects a commodity of such general use. Provided the accounts published in the French papers are not exaggerated (although such exaggeration is very likely), this new discovery may possibly bring about a change in the manufacture of sugar, for it is announced that by the new process sugar can be made not costing more than 5 francs per 100 kilogrammes, or one farthing per pound; and that in order to make it, it is only necessary to bring together certain common articles, which, after being liberated from the coarser elements with which they are combined, are known to have a chemical affinity to each other, and produce a sugar said to be equal to that made from cane-juice or beet-root. Henceforward, then, the manufacture of sugar would be placed in the hands of the maker of chemicals. It is added that the discoverer, M. Jouglet, has already sold his invention to a company for the sum of 1,200,000 francs, who intend to work the patent on a grand scale.—*The London Grocer.*

Paint Poisoning.—Investigations of much interest into the character of the emanations from metallic paints made by an experienced house painter in Paris, to ascertain whether emanations from certain paints containing such substances as white lead, zinc white, linseed oil, essence of turpentine, coal oil, etc., are injurious to health, show some noteworthy results. He caused the insides of some boxes to be painted, and within them he placed wire cages containing rabbits, which were not in contact with the paint, but only subject to the influence of the emanations from it. The rabbits suffered while the paint was fresh, especially when it contained coal oil, but none of them died. Living in apartments recently painted, and which emit the odor of oil of turpentine, is not, therefore, permanently injurious to health. Some other tests were made for the purpose of obtaining deposits of these emanations from the fresh paintings of houses. Instead of rabbits, plates containing a small quantity of water were placed in the boxes, and, after the water had evaporated from the plates, there were found some remarkable crystallizations like needles, consisting of combinations in which the oils employed formed the principal part. These crystalline combinations were obtained even when linseed was used.

Fluorene.—M. Berthelot announces, under the name of fluorene, a new and very fluorescent carburet contained in the portions of the tar of volatile oils between 300° and 340° C.

In order to extract the substance, instead of causing the portions of solid carburet which have passed the distillation between 300° and 305° C. to be crystallized in alcohol simply, a mixture of alcohol and benzine is used. By this means may be separated a small quantity of acenaphtene which remains in the mother liquor. The point of fusion of the mass, which is ordinarily 105° C. after the first distillation and crystallization in pure alcohol, increases to 112° after crystallization in alcohol mixed with benzine. The remainder of the purification consists in redistillation and crystallization in pure alcohol. The carburet possesses a quite pronounced violet fluorescence which, however, disappears promptly on its being exposed to the light.

Mercury in the System.—Prof. Hyatt delivered a lecture on mercury in Vienna, recently, when he exhibited the leg bone of a man whose death had undoubtedly been hastened by mercury. On striking the bone heavily upon the table, out fell thousands of little glittering globules of mercury—bright metallic mercury—which rolled about upon the black surface before him, collecting here and there into drops. This mercury had been absorbed during life, undermined the man's system, and proved fatal to him. The mortality among those who work in mines of quicksilver, or in the works where it is reduced, is known to be frightful. In the celebrated mines of Idria, the men work alternately one month in the mines and one in the smelting house. But notwithstanding this, it appears that of the hundreds employed there, one-fourth become salivated.

M. Gramer has devised an apparatus for determining the inflammability of petroleum oils intended for illumination. The apparatus consists of a metallic cylindrical vessel closed with a movable cover in the center of which is a hole. Through this hole projects a wick which is inserted in a tube soldered to the bottom. Another hole in the cover allows of a thermometer being fitted into the apparatus which when used is about two-thirds filled with the oil to be tested, the wick is then lighted, and as soon as any inflammable vapor is evolved, a slight puff takes place, which extinguishes the light, when the temperature marked by the thermometer is noted. The results are said to be very accurate, and the tests can be made in a shorter time than in the ordinary way with a water bath.

Our Weekly Stock Review.

THURSDAY EVE, Nov. 13, 1873.

News from most all of the mining districts is enconraging and a nnmher of new strikes and expectations of strikes are reported. The development in the Consolidated Virginia is now an established fact, and the vein is large and rich. The prospect of an ore body in the Meadow Valley has helped the Ely stocks along this week and developed more activity in them. Belcher and Crown Point did well this month, having paid out as a dividend the sum of $716,000 in coin. Belcher paid a dividend of $4 per share, or $416,000, and Crown Point paid $3 per share, or $300,000. Coneolidated Virginia hae not hegun to pay dividends yet, hut is shortly expected to do so. The first shipment of hullion from that mine on November acconnt wae $22,018.

The Consolidated Amador, the famons California mine, formerly the property of Alonzo Hayward, continues to hold its own ae a first class gold producing mine. It sends down some $50,000 per month. Some difficnlty hae heen experienced for want of water, hnt a ditch ie being huilt to supply the want. The mine declared a dividend this week, of 50 cents per share, the first since last April. The Empire mine of Grass Valley has paid a dividend for the month of 50 cents per ehare, amounting to $10,000. The Eureka (Grass Valley) pays $1 per share this month also. The Idaho (Grass Valley) pays $15 per share, or $46,500. California mines, those of Grass Valley in particular, are making a good ehowing.

We see that the Emerald Hill Mining Co., of Little Cottonwood, which levied an assesemnt on the 2nd of last month, has had an injunction served upon it so that the pnhlication of the delinquent liet has heen postponed until further notice.

Belcher turned ont last week from 13,600 tons of ore the sum of $850,000; they are now taking out 500 tons of ore per day.

Among the new stocks listed on the Board thie week is that of the Chariot mine, Banner Dietrict, San Diego county. The names of the incorporators will he found in another column. This is the "banner mine" of Banner District, and is without exception the most productive mine in the lower couutry. A cruehing of 100 tons some time since paid $23,000 or $230 per ton. In one run of 50 tons ahout a year since they cleaned np $8,100, or $160 per ton; 52 tone cruehed in Angust of laet year yielded $13,621, or $257 per ton. When first opened, the rock was packed to the mills on mnlee; since then they have a mill of their own and a good wagon road, and the waste rock sorted ont at that time paid them at the mill $100 per ton. The mine is one of great promise and, if worked now as honeetly as when in private hands, ought to he a splendid paying property and add another to the liet of California dividend paying mines.

MINING SUMMARY.

THE following is mostly condeneed from jonrnals published in the interior, in proximity to the minee mentioned.

California.

ALPINE COUNTY.

M. & N. W. Co.—Alpine *Miner*, Nov. 8: The dam ie rapidly approaching completion, and the new steam hoisting works in the Silver Glance ehaft have heen thoroughly tested hy a couple of day'e continuous work, in clearing out ruhhieh and looee rock from the lower part of the ehaft. The machinery ie a perfect euccess in every respect. It ie thonght 3 houre work in the 24 will keep the shaft clear of water.

THE Schenectady mill will etart up on Monday on a rnn of ahout 75 tons of ore.

AMADOR COUNTY.

LINCOLN MINE.—Snttter *Independent*, Nov. 7: Some very rich free gold rock is heing taken from the 300-ft. level. The ventilating winze, from the 500 to the 300-ft. level is now up hetween 30 and 40 ft. The winze when completed will give a fine circulation of air.

AMADOR MINE.—Ahout 80 tons of ore per day are now heing taken out averaging ahout $25 per ton. It comes from, the upper levels, or Boulder ledge, and from the Colton or 1,600-ft. level. A drift is being run southerly from the main shaft on this level, and has now reached a distance of 50 ft. along the vein. The maiu ehaft has been eunk a short dietance helow the 1,600-ft. level. In the hottom of the ehaft the ore vein ie wider than in the Colton level, and tbe ore of an excellent quality.

SHUT DOWN.—The sulphuret worke, which had just commenced operations, were compelled to ehut down temporarily on Thnrsday evening on account of there not heing snfficient draft in the furnacee. The chimney ie now being huilt higher in order to remedy this difficulty.

CLEAN UP.—The proceeds of the clean np at the Eureka mill laet week amounted to $28,000. The amalgam cleaned up at the Lincoln mill is now heing retorted, and we are unahle ae yet to give the result.

NEW QUARTZ CLAIMS.—Amador *Dispatch*, Nov. 8: Several new quartz claime have heen taken up during the past week, in the vicinity of Murphy'e Gulch, a ehort dietance south of town. From the proepecte thus far ohtained, it ie estimated that eome of the rock on the lead will pay $200 per ton. The ledge is narrow on the eurface, hnt it is thought that it will increase in width as they go down.

CALAVERAS COUNTY.

WEST POINT DISTRICT.—Calaveras *Chronicle*, Nov. 8: The Zacatero main ehaft has reached a hody of very fine ore at the depth of 300 feet. Ite extent ie not known as yet. The Yellow Jacket Mining Company have commenced operations on their vein, near the Ohio. A 30-horse power eteam engine ie on ite way to the mine. The new hoisting works of the Ohio will he completed next week. The splendid main ehaft of the Good Faith is down nearly 80 feet. The Good Faith property consists of the main vein and three prominent spure or feeders, all of which yielded handsomely in former timee, the furthest spnr heing some 80 feet distant from the main shaft, laterally. The Carlton mill is crushing ore from the Steveneon miue. The Harris mill is to be enlarged.

RAILROAD FLAT DISTRICT.—A large and immensely rich hody of ore hae heen struck in the 200-ft. level of the Saudereon mine. The south level is in 30 feet, the ore averaging 2½ feet thick and estimated to mill at leaet $400 per ton. The ore ie dark hlue, showing some galena and enlphurete of iron. Pruesian Hill, sinking. The Chapman mine will he startsd again in a short time.

INCREASE OF WATER.—The cool weather of the past two weeks, together with the recent ehowers, have considerahly increased the volume of water in the ditch. Although as yet there is not over half a "full head" the supply is sufficient to warrant the resumption of hydranlicing and several claims of that description will inaugurate the winter campaign during the coming week. That epecies of mining will he carried on in this vicinity the approaching seaeon upon a mnch more exteneive ecale than ever hefore, and we apprehend a marked improvement of the times in conee-quence.

SAN BRUNO — RICH DEVELOPMENTE. — We learn that a lead of very rich quartz hae recently heen uncovered in the well known San Bruno mine at Mosquito. Although a good deal of money has heen previously taken from the mine, for the past year or eighteen monthe operatious have hoken confined to running a tunnel to open the ledge at a greater depth. The tunnel is ahont 400 feet in length, and its completion has subjected the company to a heavy expense. Witbin a few days, however, the lead hae heen reached and the rock ehows remarkable well. The pay chimney ie known to he a very long one, and as the new tunnel affords an opportunity for extensive stoping, the owners cannot fail to reap the merited reward for their indnetry. The work of taking out and milling the ore is to he commenced immediately.

KERN COUNTY.

Now Running.—Havilah *Miner*, Nov. 11: There are now ruaniag regularly the Big Blne mill, the Long Tom, St. John, Bright Star and Bacchus, all on good mines. Thers are besidss, several arastra companies operating in different parts of ths county, upon small leads. This is a good showing for these dull times. Next spring, we have not the least donht bnt that three, if not five, new mills will be in operation, one at Kelso, and one mere in towu.

We are informed that the Joe Walker company have got tha Cornish pump out from beneath the water; or, rather got the water below, and have replaced it and put it in operation. There seems to be no doubt now hut that the mill will soon be runniag regularly.

The Bright Star is now ruuning on $80 rock, lead about four feet in width.

MARIPOSA COUNTY.

Hornitos Mining Prospects. — Mariposa *Gazette*, Nov. 7: Two more "little pockets" have been struck on the Duncan Vein, by some Mexicans. One yielded over 75 oances; another 39 onnces.

From Coulterville. — Favorable reports come in from the mines on the Coulterville side of the river. The Banderita and Hasloe mines are yielding an abundance of paying ore. The extension of the Hasloe prospects well.

NEVADA COUNTY.

Rich Strikes in the Mines.—Grass Valley *Union*, Nov. 6: We mentionod yesterday that the Magenta mine is developing splendidly in eix places where the drifts have been opened up for stoping. Yeeterday the ledge proved to he more than splendid in the drifts and in the shaft. The ledge in the shaft shows a remarkablo quantity of free gold, while from the drift they are taking ont gold at the rate of $100 to the panful of quartz. Specimen rock is being boxed up and will he pnt in a secure place. The Magenta is north of the Empire mine and adjoine the ground of that company.

In the Empire, yesterday, much rich rock was struck and sent to the surface. As is well known, the Empire has heen having good milliug ore regularly for over a year past, and yestorday's rich strike is thrown in as an extra affair. The Magenta and Empire are showing that the old Ophir lead hae gold in it, by the quantity, from the surface to a great depth.

Hydraulic Mines.—Nevada *Transcript*, Nov. 8: The Eureka Lake Company is enlarging its ditch and flnmes helow the old San Jnan reservoir to douhle its capacity. This company has been making great preparations for the reiny season. For many months past it has heen engaged in the work of enlarging its ditches to head waters.

After three years of steady labor, both day and night, the Enterprise Company have completed a bed rock tunnel at Snoker Flat, 2,500 ft. long. This tunnel opens a vast amount of rich mining ground.

The Milton Mining Company are pushing the work on their new ditch to their dam at Milton very rapidly. They expect to complete their ditch this winter. When this ditch is completed the miners on this ridge will have an abundant supply of water the whole year ronnd.

The Sweetland Creek mine, at Buckeye Hill, has been psying large dividends monthly to its English stockholders. At present the supply of water is short and but a few hands are at work. The company are also engaged in runing a bed-rock tnnnel at a very heavy expense.

TRINITY COUNTY.

The Big Flume.—*Journal*, Nov. 8: R. N. Davidson, Superintendent, informs us that the work of fluming Weaver Creek progresses favorably. Thirty-nine boxes have been put in this summer.

TUOLUMNE COUNTY.

Starting Up.—Union *Democrat*, Nov. 8: The claim in Sullivan's Dry Arroyo was put in motion again on Friday; two hydraulic streams made sad havoo with the dirt and gravel. It's a rocky place to work, but the gravel does pay "mighty pretty."

Washing Again.—Thursday morning, the Kincaid Flat Company, commenced again with a hydraulic. Since last washing the tunnel has been extended several hundred ft., giving a bstter opportunity to wash dirt than where they commenced at first.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Nov. 8: Daily yield, 200 tons of ore, keeping the Bacon, Mariposa and Occidental Mills running. Ore breests, both north and south, on the 1,200-ft. level, are yielding splendidly. The raise from this level is up 49 feet in fine ore. North winze is down 88 feet, the entire distance in excellent ore, tub samples from the bottom of this winze giving an average assay of $96.87 per ton, while the samples from the bottom were $141. The south winze—307 feet from the north—is down 23 feet in ore, tub samples from the bottom last evening assaying $43 per ton. The main east drift, at the 1,000-ft. level, is being driven ahead with all the vigor possible to reach the ledge and connect with the up-raise from the 1,200-ft. level, for the purpose of ventilating that portion of the mine. Sinking the main shaft is progressing at the rate of three feet per day. It is now down 65 feet helow the 1,200-ft. level. As soon as it has reached the depth of 1,300 feet, another station will he opened and a drift started for the ledge.

Dayton.—The south drift from the main west tuansl at the third station is ia 55 ft., ths face still in good ors. The north drift at this etation is in 90 ft., also in good ore. This drift is bsing pushed with vigor to rsach and prospect the rich body of ore fouad in the north drift on the level above. The sonth drift from the main west tannel is is 112 ft., ths face still in fine ore. The nerth drift at this station is in 150 feet, having reached the point where the north winze from the level ahove is expected to make the connection with it. At this point a raise has been started which is np 50 feet, and is expected to connect with the winze to-day. This will give a sapply of pure air and greatly facilitate the work on that level. The company havo 1,000 tons of ore on the dump and can greatly increaee the daily yield whenever mills oan bo obtained to crush it.

Overman. — The main west drift, at the 1,200-ft. level, ie makiug good headway, with excellent indications of sooa reachiag the main ledge.

Chollar Potosi.—Daily yiold 140 tons, assayiag $40 per tou. The different stopes and breasts show rather an improvement in hoth the quality and qnantity of ore extracted.

Crown Point.—Daily yield 450 tons. Ore breasts and stopes throughout the mine are looking and yielding splendidly. The middle winze from the 1,300-ft. level and sonth winze, on the same level, are in fine ore. Main south drift on the 1,500-ft. level is making steady progress notwithstanding the intense heat. The main drift on the 1,400-ft. level is again heing driven vigoroasly ahead. The capacity of the mills on the Carson river for crushing ore, is steadily on the increase, and the futnre prospects of the mine look brighter every day. A dividend of $3 per ehare, payable the 12th instant, aggregating $300,000, was declared to-day.

Belcher.—Daily yield of ore, 500 tons. Working capacity of mills increasing, owing to the rise of water in the Carson river. The incline is down 151 feet below the 1,300-foot level. The north drift on the 1,300-foot level from the shaft, to connect with the sonth drift from the Crown Point line, is in 115 feet. The sonth drift on the same level is in 445 feet, still in ore. The winze starting from the 1,200-foot level is down 100 feet, in ore of the nsual quality. The mine is looking splendidly throughout. A dividend of $4 per share was declared on the 5th, aggregating $416,000.

New York Consolidated.—Sinking the ehaft is making excellent progress, the rock in the bottom working much softer, with occasional streaks of fine looking quartz crossing the shaft, that give great promise. The new boilers are in place ready for use.

Sutro.—The drift weet is in 60 feet; expsct to tap the ledge at a distance of 100 feet. The face of the drift is in clay, showing some very good spots of quartz. Considerahle intereet has been taken in this mine during the past week, owing to its proximity to the Sierra Nevada mine, and to the declared iutention of the water company to hydraulic Cedar Hill (npon which the Sutro mine is situated) as soon as the extension of the company's flume is completed.

Justice.—The ore body in the north drift at the 300-foot level is gradually widening ont and improving in quality. The ore is now eight feet in width and of fine quality. The extraction of ore from the Waller-Defeat section of the mine continnes as usual, keeping the Williams & Brigg's mills steadily running. The mills have already commenced shipping bullion.

Calednonia.—The new compartment of the shaft is finished. Tho new boilers are in place, and when the new reels are once in position, everything will be in fine condition for the prosecution of the work on the lower levels. About the usual amount of ore is heing extracted, keeping the Sapphire mill steadily running.

Baltimore Consolidated. — Sinking the main shaft is making excellent progrese, the rock in the bottom working finely. The north cross-cnt, 175 feet from the west drift at the third stetion, has developed a body of ore of considerable promise.

Imperial.—Sinking the incline is making excellent headway, although the rock in the bottom continues to blast quite tough and hard.

Occidental.—The main north tunnel has been discontinued for the present on account of had air. A winze is being sunk on the ore body near whore the ore was first struck in the main tunnel and is developing some fine ore.

Ophir.—The main south drift on the 1,300-ft. level is still driven ahead. Prospecting at the 1,700-ft. level is making steady progress, with no developments of interest as yet.

Utah.—The main west drift at the first station is in 50 ft., being pushed ahead at the rate of 6 ft. per dey during the week. This drift will have from 100 to 150 ft. to run to strike the ledge.

Hale & Norcross.—Sinking the main incline is making steady progress. The yield of ore from the nppor levels is steadily decreasing.

Julia.—The main southwest drift at the 900-ft. level is making good headway, with evident indications of a near approach to the main ledge. The water in the shaft is gradually subsiding.

Empire. — Prospecting the mine is being prosecuted with all the vigor possible.

Succor.—Some fine ore is being extracted from the east drift at the second station in the shaft east of the mill. Sinking the new shaft east of the bill is making good progress.

Kossuth —The shaft is down 260 ft., and a station opened from which a drift has been started to tep the ledge.

Yellow Jacket.—The usual amount of crosscntting and prospectiug is heing done on the 1,400 and 1,500-ft. levels.

Tyler.—The main west drift at the 200-ft. station is in 44 ft., making sxcellent progrsss, with fair proepscts of soon strikiug the main ledge.

Buckeye.—Ths ore-breasts and stopes are yielding finely. The Hope mill is kept steadily rnnniag on ore from the mine.

American Flat.—The main sonthwest drift at the third station is still driven ahead toward the ledge.

Mint.—Sinking the shaft for a new level is making rapid progress, the rock in the bottom blaeting and working well.

Jacoa Little. — Driviag the main tnnnel ahead is making steady progress.

Knickerbocker.—Erecting the new hoisting and pumping machinery is making excellent progress.

Phil. Sheridan.—Work is ahout being resnmed on thie mine, which is one of tho most eligibly located on Cedar Hill, adjoining the Sierra Nevada on the north.

Gould & Curry.—The prospecting operations on the 1,500 and 1,600-ft. levels are still vigoronsly prosecnted.

Silver Hill. — Sinking the main shaft is making good progress. No water to impede the sinking. The ore-broasts on both the first and second levels are looking finely, and promise a good yield of ore for the future. The north winze from the first station on the Justice line is still in fine ore.

Arizona, Utah & Globe. — The main west drift at the 400-ft. level is still driven vigorously ahead, the face in much softer ground, showing undonbted indications of a close approach to the main ledge. The sonth crosscut from the bottom of the winze developed some fine-looking ore.

Savage.—Sinking the main incline is making good progress. Prospecting other portions of the mine continnes as nsual.

Woonville.—Daily yield, 20 tons, which is being extracted from the north stopes at the 300-ft. level. Sinking the incline is making steady progress following the ledge, and still in good ore. Sinking the new shaft is making good progress.

Sierra Nevada.—Daily yield, 60 tons. The ore-breasts and stopes are all yielding well. The mill is kept steadily rnnning, crnshing ore from the mine.

Daney.—The shaft is down 231 feet in good sinking ground. When a depth of 260 feet is reached, a station will be opened and a drift started for the ledge. It is expected that this will be done by the first of next month.

ELY DISTRICT.

Meadow Valley.—Pioche *Record*, Nov. 9: In No. 3, 11 ft. was made last week. The west drift from the 10th station has been run 8 ft.; the west from the 9th is in 225 ft.; the east, from the 9th, 323 ft.; the east, from the 8th, 385 ft.; the east, from the 520-ft. station, 246 ft..... American Flag.—At a depth of 825 ft. from the snrface there is a vein of ore varying 2 to 5 ft. As yet the extent of the ore-body cannot be determined.....Pioche.—The moving of the building and the machinery from the old to the new shaft is nowgoing on....Raymond & Ely.—The perpendicnlar shaft is now 977 ft. in depth. A new winze has commenced at the 8th level, and it is in very good ore....Washington & Creole.—There is ore in the bottom of each of the two winzes, in which workmen are now engaged. There are on the dump between 30 and 40 tons of ore....Silver Peak.—The depth of the incline is now 370 ft. The width of the ledge continnes the same. A slight improvement in the quality of the ore is noticed.... Chief of the Hill.—A progress of 14 ft. has been made in the cross-cut from the 360-ft. level. The drift et the 210-ft. level has heen run 11 ft. during the week.... Condor.—The work is being pushed forward vigorously in the drift from the 160-ft. level.... Carolino.—The shaft is now 465 ft. deep, and the men in the bottom are working in soft rock.... Chief East Extension.—At a depth of 280 ft. the ledge is 2½ ft. in width. There is ore on both the foot wall and the hanging wall.

Arizona.

YAVAPAI COUNTY.

Arizona *Miner*, Oct. 18: Messrs. Goodwin & McKinnon were mining and working richer and better ore from their claim on the War Eagle lode, Bradshaw district, than that worked by them in the late successful run. The quartz is abundant, and will pay from $20 to $100 per ton.

Persons just arrived from Wickenburg tell us that Smith's 10-stamp mill was doing well with Vulture ore. The proprietor was making moves towards erecting a furnace.

Walnut Grove continues the liveliest mining district in this part of Arizona. All the arastras are running; miners are taking out a great deal of rich gold and silver rock.

The only gold dust known to have bsen brought to town this week came from the Hassayampa. It was taken in by C. P. Head & Co., worth between $17 and $18 per ounce.

Quite recently, Jesse Jackson concluded to save the water, as it left the mill, and use it over again. This plan has enabled him to run his 5-stamp mill and arastras eight or nine hours each day. The ore he is crushing is good.

EASTERN ARIZONA.

Copper Mines.—Silver city *Mining Life*, Oct. 18: Mr. R. Metcalf is trying the smelting process which promises fair, but want of materisl for furnaces is a great drawback. So far no material has been obtained that will stand the test more than thirty-six hours, and most of the time not so long. On Friday last, a train arrived loadsd with sandstone from near Silver city, which has been tried and fouad to stand from ten to fourteen days. Mr. Bardis also arrivsd on the same dats; has purchassd Mr. Stnrenhsrg's intsrsst in the mine and expscts to commence opsrations seon. The mine now shows a vein frem two to four fest thick. There is now corded np at the mine from 150 to 200 tons of ore.

The Buck Mining Co., of Arizona, will endeavor to bring a ditch of fifteen or twenty miles long in at the head of the gulch where the elaims are located.

Colorado.

BOULDER COUNTY.

Denver *News*, Nov. 5: Within tho past year Gold Hill has developed wonderful richness in quartz, and hae proven itself to he one of the leadiag districts in the Territory. The rock carriee largo quantities of tellurium, which is found nowhere else in Colorado, and which is the richest ore known. Many lodee have been opened up which have astonished the mining communities, and, as a result, there has been a large influx of prospectors and capitalists there.

VIRGINIA CANON.

Crystal Mine.—Central City *Register*, Nov. 5: The Fulton Mining Company of Philadelphia, is operating a small force of men in tho Crystal mine, in Virginia Cañon. Twenty tons of ore, second class in quality, was hanled to Collnm's, at Idaho, this week, and, by his process of concentration, was reduced to six tons, worth 200 onnces each. The lot has just been sold to Hill. The tunnel has been driven in 75 feet, with a two foot crevice in the breast.

Idaho.

Items.—Owyhee *Avalanche*, Nov. 1: The utmost activity prevails in every hranch of mining, and we do not hesitate to predict that our camp will see better times this winter than ever before. The richness and permanence of our principal mines is now thoroughly demonstrated, which has inspired confidence at home and established for our camp a good reputation abroad.

In the Empire Snpt. Hoyt is still driving the firet, second, third and fonrth level drifts north with all possible dispatch, and will commence sinking for the fifth level about the first of next month. Althongh no stoping is heing done, yet the ore honse is full of ore taken ont of the drifts, and it is the opinion of good jndges that it will pay over $100 per ton. The Empire looks splendidly.

The shaft on the Illinois Central is 120 feet deep, from the bottom of which they are stoping north 40 feet and sonth 60 feet. The ledge is from 10 inches to two feet in width, well defined and easy worked. The last crushing yielded $122 per ton, and they will have 54 tons equally as good ready for crushing next week.

Lower California.

The New Diggings.—San Diego *Union*, Nov. 6: Since the discovery of the diggings there has been quite a rush from all quarters, There are now about 100 miners in the camp, and fully thirty of them are either Americans or foreigners. The distsnce from San Diego to the mines is about one hundred miles. All of the new comers pronounce the diggings good. Water has not been plentiful; the miners have been carrying the dirt about three miles to wash it. Several wells are now hsing dug in the bed of a creek close by the camp, and plenty of water has heen found at a depth of 12 ft. Most of the miners have been making from $1.50 to $2 apiece, per day, (six hours) washiug with pans, and from $4 to $5 per day washing with rockers. There is plenty of feed in the neighborhood of the diggings. The locality has not been prospscted much yet, hut placer gold has been found over an area of country 25 miles in extent. In about six weeks rain and snow will commence to fall in the mountains, and then there will be an abundance of water. Already the miners have commenced to build log houses. There is plenty of pine and cedar. The road from San Diego to the mines is good, with water at short distances.

A dispatch from San Diego, Nov. 8th, states: News from the Japa placer diggings, in Lower California, is more exciting. The ground, from the surface down to the water, eight or ten feet, is said to be filled with fine gold. A handful of dirt taken from any place in the locality and washed, gives a pay showing. People are flocking to the diggings from every quarter. Parties are generally made up or pass through here.

Montana.

Boulder Valley.—*Montanian*, Oct. 30: We hear it reported that one-third of the Bismarck lode, in Boulder valley, owned by Mr. Vincent, has been sold to a New York Company for pretty large figures. It is also stated that an interest in the Rumley lode, on the Boulder, has been purchased by S. T. Hauser.

The cold weather that has prevailed for a week past, has greatly retarded mining operations throughout the county, and indicstions are that all hydraulic miniug will be suspended by the 10th of November.

The Flint Creek Ditch is progressing rapidly, but the contractors want more men to work on it.

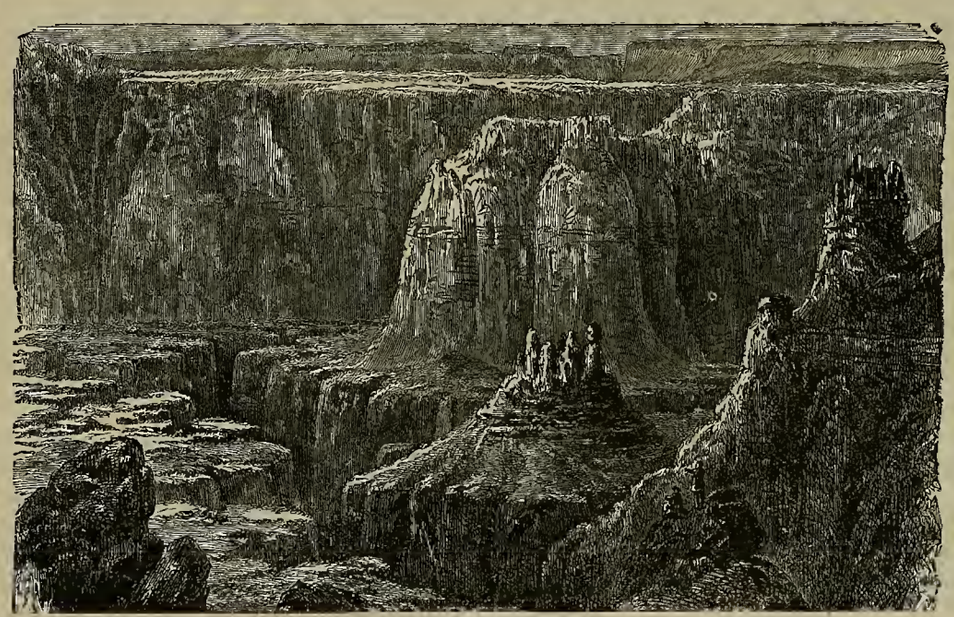
Mr. A. C. Hall deposited for shipment at the two banks in this city, on Monday, six hundred and eighty ounces of gold dust—the last clean-up of Hall & Hyde's flume at Summit. Over twelve thousand dollars at one clean-up isn't so bad.

[Continued on Page 320.]

The Chasm.

A Scene in Colorado.

The dweller in the crowded city, whose streets are filled with the surging throngs of commerce, has but a poor idea of the vast and wonderful scenes of Nature, which seeme to have selected the lone epots of the earth for the display of her mightiest wonders, and to have hidden them away in majestic solitudee, almost unapproachable by the feeble footsteps of man. Such scenes as those, one of which is depicted in onr engraving, present themselves only to the wild hunter, to tbe Indian eon of the desert and the mountain, or to the intrepid explorer in search of the scientific secrets of the metalliferous treasures of Nature. In earlier days, however, they were sufficiently familiar to tbe eyes of the emigrants who, croeeing the plains, had in order to reach the golden land to struggle throngh the cañons. and climb the peaks, and skirt the precipices of our mighty mountains. The land whose hills pierce the heavens and give birth to the mighty streams that feed the Mexique Gulf and reach the sea of Balboa is seamed with mighty chaems carved ont by the waters in the course of untold centuries. Their depth is as the height of mountains, one being lately described whose mnral precipices loomed tbree thousand feet above the shining waters that laved their almost invisible bases. Some of the cañons of the Colorado wiud hundreds of miles into the inmoet recesses of the mountains. There is no sameness about their appearance, for an infinite variety of forms, some beantiful, otheregrand and awfnl, present themselves to the eye of the explorer. Here the cañon widens out into a broad valley, there the rocks rise from the edge of the water perpendicularly, and from above it looks with the stream that flowe through it, like a silvery thread winding afar through the mountains. The scene presented in our illuetration, where there is a margin left on either side of the water, is not nncommon. Here the cañon is wide, with walls that almost hide away the heavens and leave nothing visible save a small patch of distant eky, the leaping river that dug out the abyee, aud the encircling rocks that have beeu carved by the waters, the winds and the slow dissolvent power of the air into a myriad of fautastic forms. In one place you see the semblance of rocky domes, and pinnacles, and towers; in another is presented in miniature a picture of the serrated hills iu whose bosom the cañon is sheltered. Originally the vast plateau of the Rocky Mountains with its crowning peaks was raised above semi-tropical seas. Exposed for nntold ages to the action of the wind and rain and air, and of the streams that issued from their womb of waters, the softer rocke have been worn away, some mountains rounded, others serrated, and these abysses leading into the bowels of the mountains opened.



THE CHASM.

THE WORK AT HELL GATE.—The report of General Newton on the work done at Hell Gate during the laet year shows that the progrese made in driving forward the tunuele and galleries was 2,731 lineal feet. The quantity of rock removed during this period was: By hammer drilling, 1,750 cubio yarde; by the Burleigh drills, 7,619 cubic yards, and by tbe two diamond drills, which were at work during July and part of Angust, 185 cubic yards. The total removed was 9,554 cubio yards. The number of feet of holee drilled was 95,851, or at the rate of ten lineal feet of holes drilled to one oubic yard of rock. The quantity of explocives ueed to blaet thie length of holes was 11,808 pounde of nitro-glycerine, 1,218 pounde of giant powder, and 3,445 pounds of black powder, divided into 23,592 oartridges—*i. e.*, an average of one oartridge to four feet in length of hole. The length of Buckford fuee expended was 94,150 feet. The average spend of the hammer drilling per shift of eight houre was 5.4 feet, or at the rate of 2.7 feet for each man of the gang. Tbe number of drills sharpened for hammer work was 34,529 and the loss by abrasion and dressing was 2,952 pounds of Englieh eteel, or nearly three ounces per lineal foot of hole drilled. Oue thousand feet of tunnels remain to be excavated.

PREVENTING FIREE ON BOARN SHIP.—Dr. M. Schuppert, of New Orleane, proposee to have, in the holds of vessele whose cargoes are liable to epontaneous combuetion, boxes filled with marble duet, into which pipes are to be led to convey dilute eulphuric acid. The carbonic acid gae disengaged by the contact of the eulphuric acid will extinguish the fire; and Dr. Schuppert pointe out that the gas, being heavier than atmospheric air, oan easily be confined to the hold of the vessel.

The Liability of Stock Brokers.

A case wae decided last week in the Fourth District Court by Judge Morrison which is of great interest ae showing the relation of agent and principal in stock operations. The caee was tbat of Margaret L. Whittaker against McDonald & Wbitney. Ite bistory is abont as follows:

Tbe facte ehow that defendants, McDonald & Wbitney, who are stockbrokers in this city, were employed by the plaintiff to purchase certain mining stocke for her, consisting of Savage, Crown Point, Yellow Jacket, Consolidated Virginia and several others, "*buyer* 30." These stocks were bought by McDonald & Whitney, and the margin required by the rules of the Stock Board was put up by the plaintiff —a margin of 20 per cent. Tbe stocks were held for some time, until by a fall in the market the margin was uncovered, and McDonald & Whitney notified the plaintiff that she must pay them what she owed them. A written notice to this effect was in the first place sent to her. She called to see them, and gave them to understand that if she could raise the money she would pay them. She also gave them to understand subsequently, that she was negotiating for the loan of the money, and would probably be able to get it. She was then notified positively that unless she paid the amount due, the defendante would sell her stock in the board the next day. The following day, at the afternoon eession, the plaintiff's stocke were sold by the direction of the defendants, by the President of the Stock Board. That wae about the 5th or 6th of May, 1869. The defendante sent her an acconnt of these sales, and in the following December she called upon them and demanded the balance in their hands alleged to be due her, about $1,800 or $2,000. They did not deny the indebtedness, but owing to some troubles which had grown ont of stock transactions, between the plaintiff's brother-in-law, one Coon, and the firm of Cahill & Co., McDonald & Whitney refnsed to pay the balance at that time. Thinge went on without any more being said about this matter until the following April. At that time mining etocke advanced to almost unprecedeutly high prices, and then the plaintiff brought her action againet McDonald & Whitney, claiming $150,000 damages for the nnlawfnl convereion of these etocks.

The plaintiff relies mainly upou two points ae grounds upon which she is entitled to recover in this cäee. In the first place, it ie contended that, under the circumstances, McDonald & Whitney had no right to eell theee stocks at all; and in the second place, that they had no right to sell them in the Stock Board.

This second point has been very much discussed in the numerons cases which have arisen, not only in this country, but in England; and the authorities thereon are conflicting. The qnestion, whether a persou dealing with a Broker, deale with him subjeot to the rules of the Stock Board, is one upon which the authorities appear to be very much in conflict. In the English Courts, however, the rule seeme to be well settled that "one who emyloye a Broker to transact business for him upon the Stock Exchange or other general market, impliedly authorizes him to deal according to the general and known usages and customs of that market, although he may not himself be aware of their exietence." Grissell *vs.* Bristowe *et al.*, First Common Pleas, page 112.

To the eame effect ie the case of Duncan *vs.* Hill; Court of Exchequer, page 262. And to the eame effect, also ie the case of Pollock against Staples; 12 Queen'e Bench, page 765. The eame doctrine is held by the Supreme Court of Maryland in the caee of Maryland Fire Insurance Company against Dalrymple: "A eale at the Board of Brokers, publicly and fairly made, would in our opinion, have been legal and valid, and if the sale of the 20th of November had been made to a third person, it would have been a legal sale." So says the Court. The same point ie decided by the Supreme Court of Maryland, in the latter case of Rosenstock *vs.* Tormey, 32 Marylaud, 178.

The case of Markham againet Jandon, 41st New York Reports, page 243, ie relied upon as an authority the other way. And it seems to eustain the view upon this point, preeented by the plaintiff, and it is conflict with the authorities to which I have referred, ae well in conflict with other New York cases decided previously, wbich it overrules.

The [Purchase Was Made Under Rules of the Stock Board.

The Court is in tbis case, however, relieved of tbe duty of paseing upon these conflicting authorities, for the reason that tbe plaintiff, when these stocks were bought, gave McDonald & Whitney written orders in tbis form: "Please buy for me, for my account and risk, twenty-five shares of Overman at $95 per share, payable in gold coin of tbe United States, subject to the rules of the San Francisco Stock and Exchange Board." It is very clear to my mind that in giving these orders, the plaintiff adopted the rules of San Francisco Stock and Exchange Board, and that these rules were incorporated into, aud became a part of the contract. When McDonald & Whituey bought theee stocks, buyer 30, under these orders, they were bought subject to the rules of the San Francisco Stock and Exchange Board, and those rules provide that if the margin is not kept good (the 20 per cent. margin) tbe broker shall have the right to sell the stock, upon snoh a notice as was given in the case. It is shown that the stocke were sold, in tbe manner and form prescribed by the rules of the San Francisco Stock and Exchange Board, and that they were sold for all that they were worth at the time the sale was made. In my opinion, tbe eale was a good and valid one, and one which McDouald & Whitney had a right, under tbe circumstunces, to make.

Ground of Defense.

But there is another ground upon which the learned counsel for the defendants rely in thie case, and that is that, even if McDonald & Whitney sold these stocks without authority and in violation or the duties which they owed their principal, and thereby became liable ae for a conversion, their unauthorized act wae subsequently approved and ratified by tbe plaintiff. It will be borne in mind that theee stocks were sold in May, 1869; that an account was rendered at that time; that no objection wae made by the plaintiff to the sale; that in the following December the plaintiff demanded of defendants the balance remaining in their hande due plaintiff ae the proceeds of the sale. And another fact which the Court has not yet noticed, but which appears from the evidence, ie that in a caee in which the plaintiff was a defendant she filed an answer in which she averred that McDouald & Whitney had about $2,000 of her mouey in their hands, evidently referring to the money aeceived by them upon the sale of these stocks. She demanded the money in December, 1869, and not until April, 1870, did she think—so far ae the evidence showe—of commencing this action for an unlawful conversion of these stocks.

No Advantage Taken of a Depressed Market.

It ie also in evidence before the Court that in the interval betweeu the sale of these etocks and the commencement of thie action McDonald & Whitney could have replaced the stocks at a cost of between $10,000 and $12,000 *less than they were sold for*. But during all tbis time of depreesion, when the plaintiff would have been a loeer if she had repudiated the act of McDonald & Whitney in selling the stocks, she remained silent, or rather ehe gave them to underetand by her conduot that she acquiesced in what they had done.

A Principal Must Repudiate the Unauthorized Acts of an Agent.

Now, it is a well settled rule of law, that if a person assumes to act as the agent of another, without authority, such act may be ratified by the principal, and such ratification is equivalent to a prior authority, and even the silence of the priucipal may amount to a ratification. Upon this point the authorities are numerous; and the principle seems to be fully eetablished. In Story, on Agency, Section 255, it is said that "long acquieescence, also, without objection, and even the silence of the principal, will in many casee, amount to a conclueive presumption of the ratification of an nnauthorized act; especially, where such acquiescence ie not otherwise to be accounted for, or such eilence is either contrary to tbe duty of the principal, or it has a tendency to mislead tbe agent."

In the caee of Crane *vs.* Bidwell *et al.* 25 Missiesippi 513, the Court says:

"But if it be conceded that he (the principal) had a right to disavow the act of the agent in thie particular, it was his duty to have done so when first informed of it, and to have notified the defendant thereof."

In the case of Norris *et al. vs.* Cook *et al.*, 1, Curtie' Reports, page 469, the learned Judge says, quoting from the decision of the Supreme Court of New York:

"It is a salutary rule, in relation to Agenciee, that when the principal has been informed of what has been done, he must diesent, and give notice in a reaeonable time, otherwise his aesent to what has been doue shall be presumed."

In the case of Owsley *vs.* Woolhopter, 14 Georgia, page 128, the Court says: "Indeed, if the agent, without anthority, should do any act, and the principal, after a knowledge of the fact, should make no objection, but acquiesce for a length of time—especially where such acquiescence cannot be explained or otherwise accounted for, and which hae a tendency to mislead the agent; in all such cases, and many others, which migbt be supposed, the law would construe such silence as contrary to the duty of the principal and he would be held bound by it."

The same view is held in 1et Livermore on Agency, pages 45 and 47. In Hanks *vs.* Drake *et al.*, 49 Barbour, page 186. It appeared that the plaintiff received information of the eale by the broker on the 20th of May and in September demanded his account aud made no objection thereto; and commenced suit in December. He was held to have ratified the acts of the broker.

The Plaintiff Ratified the Acts of the Brokers.

These authoritiee are, to my mind, conclusive upon tbe point that the plaintiff in thie action, by her long aquiescnce, after being informed of whet the defendents had done, and by demanding the balance remaining in the bands of Wbitney & McDonald, on accouut of these sales, ratified the acts of McDouald & Whitney in making the sales; even conceding for the purpose of argument, that by such acts they were guilty of couversion.

The evidence satiefies me that the plaintiff never thought of bringing thie action until sbe was stimulated to do so by the almost unparalleled rise in these stocks, aud then, for the first time, she conceived the idea of holding defendants liable in damages for a conversion of her property. In my opinion this case is wholly without merit.

There is a balance due by McDonald & Wbitney; but it cannot be recovered in this form of action. Thie action is for a tort, for an unlawful conversion of property, and the balance dne plaintiff by defendants can only be recovered in another form of actiou, a form of action founded on contract. The distinction between actions arising out of torte and actione founded on contracts ie well eettled, and is euch that a party in an action for a tort cannot recover money due on a contract.

Let judgment be entered in favor of the defendants.

THE WINTERS' QUICKSILVER MINE IN MONTEREY COUNTY.—John B. Wintere gives to tbe *Territorial Enterprise* the following information concerning the mine located by him in Monterey county, California: "It is eituated in the Coast Range mountains, at the head of Chalamot creek, in the north-west corner of Monterey county. The lead ie abont fifty feet in width and crops out for a distance of half a mile. The lead is about a mile and a quarter above the valley of Chalamot creek and the route by which it ie reached ie steep. A large ravine cuts through the lead and along this ravine are to be seen boulders of several tons weight tbat have been torn from tbe vein. About thirty yarde below the vein in this ravine ie a fine spring. In the bouldere and in the croppinge of tbe ledge are to be seen small streaks of cinnabar and other traces of quicksilver. A party of five men have been eet to work to run a tunnel into the vein. Ae yet the company have only what they believe to be excellent indicatione of a large and valuable mine."

Useful Information.

How to Improve the Appearance of Furniture.

Mr. G. J. Henkels, of Philadelphia, Pa., suggests that when the polish on new furniture becomes dull it can be renewed by the following process: Take a soft sponge, wet with clean cold water, and wash over the article. Then take a soft chamoie skin and wipe it clean. Dry the skin as well as you can by wringing it in the hands, and wipe the water off the furniture, being careful to wipe only one way. Never use a dry chamois on varnish work. If the varnish is defaced and shows white marks, take linseed oil and turpentine in equal parts; shake them well in a vial and apply a very small quantity on a soft rag until the color is restored; then with a clean, soft rag wipe the mixture off. In deeply carved work, the dust cannot be removed with a sponge. Use a stiff haired paint brush instead of a sponge. The cause of varnished furniture becoming dull, and the reason why oil and turpentine restore its former polish, it will be appropriate to explain. The humidity of the atmosphere and the action of gas cause a bluish white coating to collect on all furniture, and show conspicuously on bright, polished surfaces, such as mirrors, pianos, cabinet ware and polished metal. It is easily removed as previously directed. The white scratches on furniture are caused by bruising the gum of which varnish is made. Copal varnish is composed of gum copal, linseed oil, and turpentine or benzine. Copal is not soluble in alcohol as other gums are, but is dissolved by heat. It is the foundation of varnish, as the oil is used only to make the gum tough, and the turpentine is required only to hold the other parts in a liquid state, and it evaporates immediately after its application to furniture. The gum then becomes hard and admits of a fine polish. Thus, when the varnish is bruised, it is the gum that turns white, and the color is restored by applying the oil and turpentine.

If the mixture is left on the furniture, it will amalgamate with the varnish and become tough, therefore the necessity of wiping it entirely off at once. To varnish old furniture, it should be rubbed with pulverized pumice stone and water to take off the old surface, and then varnished with varnish reduced, by adding turpentine, to the consistency of cream. Apply with a stiff haired brush. If it does not look well, repeat the rubbing with pumice stone, and when dry, varnish it again.

Moths in Furniture.

The same author says: There are two species of moths which infest furniture. One is a large fly of silvery white color; the worm of the same is shaped like a chestnut worm, and is familiarly known. It rarely infests furniture. The other is a small fly of a dark drab color; the worm is about one-fourth of an inch long, and tapering from the head to the tail. It was first observed by upholsterers about thirteen years ago. This fly penetrates a sofa or chair, generally between the back and seats of sofas, or under the seats, where the vacancy among the springs affords a safe retreat. It may make a lodgment in one week after the furniture is placed in the house. If such should be the case, in two months the worm will appear; and the continual process of procreation in a few months increases the number to thousands. This moth has no season. It destroys in winter and summer alike, and it is kept in active life by the constant heat of the house. We find at the same time, in the same piece of furniture, the fly, the worm, and the eggs; thus showing that they are breeding and destroying all the time. It does not eat pure curled hair, but fastens its cocoon to it, the elasticity of which prevents its being disturbed. The inside of furniture is used by it only for the purpose of propagation. The worm, when ready for food, crawls out and destroys the covering, if of woolen or plush material; and falling to the carpet, destroys it. It rarely cuts through plush from the inside, as it is of cotton back, but there are instances where the worms have cut up muslin on the outside back of sofas. There is no protection against them but continual care. New furniture should be removed from the walls at least twice a week at this season of the year, and should be well whisked all around, and particularly under the seats, to prevent the fly from lodging. This is an effectual preventative, and the only one known. Cayenne pepper, Scotch snuff, camphor, turpentine and all other remedies for protection from the large moth are of little or no avail against the furniture moths. Saturation with alcohol will not destroy them when in a piece of furniture.

If the furniture is infested, they may be removed by taking off the muslin from under the seats and off the outside ends and backs, where they congregate most, and exposing to the air as much as possible. Beat well with a whisk or the open hand, and kill all the flies and worms which show themselves. This done often will disturb them, and may make them leave the furniture, in their desire to be left in quiet. When the furniture is free from moths and is to be left during the summer months without attention, it may be protected by camphor in small bags or highly concentrated patchouli. The safest way is to have the furniture well whisked twice a week. If the moths attack the carpet, which they will first do under the sofas and chairs, spread a wet sheet on the carpet and pass a hot flat iron over it quickly; the steam will effectually destroy both worms and eggs.

If furniture is delivered in a dwelling free from moths, the upholsterer's responsibility ends there and all rests with the housekeeper, as no tradesman can tell whether the moth will attack it or not. There are cases where the furniture has been in use ten or twelve years before being attacked. It would be as fair to hold the tailor responsible for the safety of clothing from moths as to hold the upholsterer responsible for the safety of furniture.

An Anatomical Hint.—Dr. Herman Meyer, of Zurich, asserts that a shoemaker ought not only to produce a shoe that does not pinch, but a shoe so constructed that it will give to a foot distorted by the pinching it has borne already, a fair chance of a return to its right shape, and full possession of its power as a means of carrying the body onward. He says that in measuring a foot for a shoe or boot, the first thing to be considered is the place of the great toe. Upon this toe, in walking, the weight of the whole body turns at every step; in a natural foot, therefore, it is in a straight line with the heel. A central straight line drawn from the point of the great toe to the middle of its root, if continued, would pass very exactly in the middle of the heel. But, by the misfitting boot usually worn, the point of the toe is pressed inwards, the root outwards. No last, or model of a foot already injured by wearing ill-fitting boots or shoes, should ever be made of the exact size of such a foot.

Good Health.

Heart-Disease and Overwork.

The early break-down of health observed among Cornish miners, and commonly regarded as an affection of the lungs—"miner's phthisis"—is declared, by competent authority, to proceed rather from disturbed action of the heart; and this, according to Dr. Houghton, the distinguished Dublin physiologist, is caused by the great and sudden strains put upon the system by the ascent from the pits, at a time when the body is not sufficiently fortified with food. In his valuable address on the "Relation of Food to Work," Dr. Houghton says: "The labor of the miner is peculiar, and his food appears to me badly suited to meet its requirements. At the close of a hard day's toil the weary miner has to climb, by vertical ladders, through a hight of from 600 to 1,200 feet, before he can reach his cottage, where he naturally looks for his food and sleep. This climbing of the ladders is performed hastily, almost as a gymnastic feat, and throws a heavy strain (amounting to from one-eighth to one-quarter of the whole day's work) upon the muscles of the tired miner, during the half-hour or hour that concludes his daily toil. A flesh-fed man (as a red Indian) would run up the ladders like a cat, using the stores of force already in reserve in his blood; but the Cornish miner, who is fed chiefly on dough and fat, finds himself greatly distressed by the climbing of the ladders—more so, indeed, than by the slower labor of quarrying in the mine. His heart, over-stimulated by the rapid exertion of muscular work, beats more and more quickly in its efforts to oxidate the blood in the lungs, and so supply the force required. Local congestion of the lung itself frequently follows, and lays the foundation for the affection so graphically though sadly described by the miner at forty years of age, who tells you that his other works are very good, but that he is 'beginning to leak in the valves.' Were I a Cornish miner, and able to afford the luxury, I should train myself for the ladder-feat by dinning on half a pound of rare beefstake and a glass of ale from one to two hours before commencing the ascent."—*Popular Science Monthly.*

The Fruits as Diet.

Fruit properly used, it is acknowledged, has a healthful effect. Eaten raw, this is the case; cooked, it is in general better, and then may be used to advantage with the regular meal.

It has been found more recently that the fruits are more nutritive than was formerly supposed. There is more water than with solid food, hence they are more diluted, but also more grateful with their sub-acid and aromatic properties which, with the rest, have a medicinal as well as nutritive effect—all favorable if properly indulged in. Green or unripe fruit contains a poisonous acid, and should not therefore be used, though cooking remedies this to some extent.

Perhaps chief among the fruits should be put the grape; it contains with the apple, the most soluble, that is, digestible material, of any of the fruits. Except the cherry and the whortleberry, it shows a greater percentage of nitrogen or the flesh-forming principle, falling but a trifle below these two. Apples also rank high. They are hence widely used and with advantage. A ripe apple, of a sub-acid character, baked slow and long till reduced to a fine pulp, is one of the most grateful and is the most nutritive of all the fruits, being unsurpassed as a table relish to take with the meal. It also finds its way frequently to the sick room with benefit.

But variety is wanted. The pear too is nutritious; but it has a short season. So with the berries. The blackberry is the most healthful of all the fruits, and is also very grateful; it can hardly be eaten to excess so as to occasion harm, which is not the case with the more aromatic strawberry, which, though strong in flavor, has yet a comparatively small amount of the nutritive elements, but little exceeding the blackberry. It is the apple and the grape that concern us most, as these may be kept, the first, if need be, the year through, the latter half that time.—*Indiana Farmer.*

Coffee and Milk as an Aliment.

Pere Maigne discourses as follows with regard to a table beverage, very agreeable and very common among the American people: "M. E. Marchland solves, in a very happy manner, the question so long agitated, of its advantages and disadvantages. Milk is a valuable aliment, suitable for all ages, all temperaments, and all conditions, and is always a harmless and nutritious food, when the person who takes it is in good health. It is also well known that clear coffee is a valuable stimulant and tonic, and, taken after a meal, facilitates digestion.

"Now, it is a remarkable fact that this milk and this coffee, which are so well assimilated, when they are taken separately, and with an interval of time between, constitute, by their mixture, a new agent, a new compound, absolutely indigestible, and, consequently, absolutely unassimilable, when the mixture is made in the right proportions. And it is still more remarkable, and even surprising, that to this the compound owes its reputation, among the laboring classes as a strong aliment. This needs an explanation. The infusion of coffee is rich in tannin. When it is mixed with milk, there results immediately a transformation of the albumen and casein which it contains into a sort of imputrescible, indigestible leather, like that which is formed in a tan-vat, in which animal tissue has been immersed. Such a compound cannot always be taken out with impunity. Those who are not accustomed to it are frequently subjected to a purgative effect consequent upon indigestion, and those to whom it is apparently innocuous, sometimes end by experiencing gastric difficulty, or disarrangements of the digestive organs. It may be well to make them understand that the best made coffee, with milk, is, in reality, only a sort of leather soup. We launched the same anathema against coffee and milk twenty years ago, without being listened to."

Dr. E. M. Hunt thus generalises on the facts of digestion: Food should pass into the stomach in a finely divided state. The rapidity with which digestion is performed, depends upon various circumstances. Strong emotion, as anger or grief, will retard it; moderate exercise hastens it, and thus the state both of body and mind influences it. A usual meal is generally digested in a healthy person in from three to five hours. A mixture of food is not especially objectionable, except as by variety it encourages the appetite, and often leads us to consume more than is needful. Animal food is digested more quickly than vegetable, and solid food more speedily than soups. Oily food is more quickly appropriated by the system than muscular fiber, when agreeing with the stomach. Uncooked oil is more digestible than cooked. Cream and butter are the purest of oils. Boiled meats are most digestible, roasted next, broiled and fried the least so. Bulk is necessary to digestion. The people of cold climates who live much on fats, mix crude matters, sometimes even sawdust, with them, and thus find them more readily digested. Milk is among the most nutritious and digestible of foods. It is considered constinating, but the chief reason is that it is almost entirely taken up by the system, and no residue left. With the same exertion, we need richer food in cold weather than in warm. Never eat between meals, unless extra exertion or exposure require it, and then select hearty and quickly digestible food. As a rule, ripe fruits or vegetables are more digestible than green, and green fruit stewed more digestible than when eaten in the raw state. Smoked meats are less digestible than fresh, and of smoked or salted meats, the inner portion is more easily digested than the outer part. The inner part is preserved as much by the saltpetre and the exclusion of the air, as by the salting and smoking process, and is in a state more allied to preserved fresh meat. Dried fruits, as prunes, raisins, apples, etc., are unfit to eat unless well cooked, and all unbroken seeds are indigestible. Alcoholic stimuli, or condiments of any kind, are not necessary in healthy conditions of the stomach.

Lead Poisoning.—Dr. Wittstein has analysed the constituents of the capsules used for champagne, beer, and mineral water bottles, and he finds that, so far from being made of tin, with an addition of lead, they are rather made of lead, with a small addition of tin. In half a dozen cases he found that the percentage of load was 90. Thus champagne capsules contained 90.13; mineral water capsules 93.1; and beer capsules from 94.2 to 99.4 per cent. of lead. The prevalent habit of covering the top of the bottle with the capsule after the cork has once been drawn, is consequently to be deprecated. The acid contents of the bottle in contact with the capsule at the mouth of the bottle, even in minute quantities, necessarily produces a deleterious solution of lead.

Domestic Economy.

Food and its Preparation.

The following notes are taken from an interesting essay by Dr. George Derby, Secretary of the State Board of Health of Massachusetts, treating upon the forms of food in common use throughout that State, how they are prepared and how they are eaten, together with the considerations whether this food, as generally used, promotes public health, power and usefulness. The question:

Is Such an Article Wholesome or Not?

Cannot be truly answered in a general sense. Very few articles ranked as good are absolutely unfit; but a man laying a stone wall may digest and thrive on diet which would be very unwholesome to him if employed in shoemaking or other sedentary occupation. Of the many causes of consumption, want of proper food is surely one, and there is good reason to believe that the many forms of dyspepsia so commonly met with are but too often the danger-signal that Nature gives us to show that the food, either in its quality, its preparation, or its variety, is unsuited to maintain the vital process. It is but a modified form of starvation, with the mockery of a display of abundance.

Bread.

Leavened or fermented bread is as old as the time of Moses and its value has been fairly tested. Whatever be the precise action of the leaven, it transforms grain by partial decomposition of its original elements, and leaves as its resultant what men in all ages have approved. Modern substitutes impair the flavor, diminish the nutritive property, and break the staff of life. Bakers' bread is almost universally composed of flour with extraneous substances, alum and carbonate of ammonia being most employed. Bread hastily made in families is mixed in a variety of ways with carbonates of soda or potash, combined with phosphate of lime, with cream of tartar or with sour milk, and is generally imperfectly cooked. Very often the elements of wheat and fat which the body demands are furnished in underdone pastry made of flour and hogs' lard; the first legitimate effect of such food as this with people of average condition is indigestion or dyspepsia; the second is all that train of ailments caused by imperfect nutrition. Good bread should be made from a mixture of flour such as is generally used in our markets, water, salt and yeast, and nothing else. The yeast is composed of malt, potatoes and hops, and the dough, kneaded for from one and a half to two hours, is then thoroughly baked.

Variety of Food.

Experience has proved that, for some reason unknown to science, variety is essential to health after reaching the age when we are free to choose our food. The perpetual recurrence of the same edibles, even though their number be considerable, becomes in all periods of life except infancy, not only wearisome, but positively injurious. The lack of variety in many cases is due to the poverty of poorer classes and the difficulty of buying fresh provisions in places remote from markets. Salt-pork, salt-fish, and potatoes, with pies, poor bread and Japan tea, are the staples of food of thousands of families during our long winters. It should be understood how needful a change of diet is from time to time. Fresh vegetables, particularly in the country, are readily obtained and preserved, and should be unsparingly used. The edible roots, as turnips, carrots, onions, and beets, and cabbage, are as well worth preservation as the omnipresent potato. All these vegetables need thorough boiling, and more than they generally get.

Frying Meat.

A common habit in American cookery, is most unprofitable to the eater. It robs the meat of its juices and hardens its texture. The extreme heat of the fat not only burns the outer layers of the meat, so as to injure their value for nutritive purposes, but also changes the chemical condition of the fatty acids, giving rise to products which obstruct the breathing and cause tingling of the nose and eyes of the cook, and which are more or less harmful to the eater. The peculiar flavor of the meat is in a great measure lost by frying, and for it is substituted the flavor of the fat in which it is cooked. This fat permeates the fibers of the meat in such a way as to render them less soluble in the watery fluids of the mouth and stomach, and thus cause difficult digestion. Broiling on a gridiron over a quick fire costs a little more time and trouble, and very likely fuel also, but by this process the juices of the meat are sealed up (to a certain extent) instead of being evaporated, and the nutritive value is thereby much increased.

How to Iron Linen.—A *Hearth and Home* correspondent says linen that is placed immediately after being ironed near the stove or in the hot sun, is stiffer when dry than if it is permitted to dry slowly. It is a good plan to lay collars and small articles on a waiter, and set them on a kettle or other support on the stove, till they are quite dry. Sometimes the iron will stick in a manner quite unaccountable; if it is rubbed on a board on which fine salt has been sprinkled, and then passed over a brown paper with wax in its folds, the sticking properties will be checked. A bowl of clear water and a clean old linen cloth, are useful to remove any specks the linen may acquire before or while being ironed.

MINING AND SCIENTIFIC PRESS.

Metalliferous Mines of Wales; The Tecumseh Mining Company; The Coal Mines of Amador; New Mill at Eberhardt; Mariposa Mill; More Coal Discoveries; Quicksilver Suggestion; Replacing a Severed Finger, 314. Mineral Oils for Iron; Willow Creek Mines; Worth Knowing; A New Needle Gun, 315.

Our Oldest Corporation.

The Ural Mining Company, incorporated in August 26th, 1851, is the oldest mining incorporation in the State. Since that time, according to the *Post*, the number of incorporations of all kinds organized in this city is 5,752. The Ural Company was organized with a capital stock of $40,000 in 40 shares, which shows how modest people were in those days as compared with the present when companies are not stocked for less than a million, and some ten millions. The articles state that the company was formed "for the purpose of quartz mining and extracting gold from the quartz rock by pounding and crushing the same. Now-a-days the articles claim all sorts of things, such as mining, milling, building roads, cutting timber, doing a transportation business, buying and selling real-estate, etc.; the principal object—namely, selling the stock—is carefully omitted in the articles of incorporation.

The incorporators of the Ural were John S. Hagar, Joseph Bidleman, Wm. H. Block, Jas. Blair, James Whitney, E. M. Block, Joel F. Lightner, William Norris, B. D. Baxter, D. S. Lord, F. Butler King, and Greenville A. Meudon. The company was to mine on the Eureka and Inyo vein, in Nevada County, Cal. Of course long before this incorporation was formed, numbers of companies were organized without the formality of any regular incorporation, and that kind paid best in the end. Where a few men were working in their own interest, all equal owners, there was more to encourage them to labor earnestly than where one or two owned a controlling interest. This holds true now as well as then, and as a general rule the small companies pay much better than the large ones. We mean legitimate mining, of course, not stock-speculating operations.

The San Juan Mines.

Considerable interest is being manifested just now concerning the San Juan country and its mines, and glowing accounts of the district appear in the papers from the pens of correspondents, most of whom, however, know little about mining, judging from their effusions. The specimens of ore recently exhibited at the Territorial Fair, in Colorado, have had the effect of creating an "excitement," and numbers of people are going to the new mines just as winter has set in, contrary to the advice of those who have been there, and know what the winter is. Mr. P. H. Newbill, who has been in this State some twenty-one years, and has been "in the mines" a portion of the time, spent the past summer in the San Juan country, and returned to this city last week for the winter. In conversation with him since his return we learn some interesting facts concerning the mines there. He says that there have been in all about 500 people there this year, but not more than 300 at one time. There was only one other Californian there besides himself, most of the prospectors being Colorado men, but quite a number from Kansas and Dacotah. The majority of the men there know nothing at all about mining, but were stock men, farmers, etc., a fact which may account for the wonderful reports of richness we see in print. They talk of rock *yielding* $2,000, $3,000, $8,000, and even $15,000 per ton, which is of course all "bosh," especially in connection with the statement that the leads run from 30 to 80 feet in width, all mineral.

Mr. Newbill says that nearly all the prospectors have left for the winter, most of them, however, himself included, intending to return in the spring. The country itself is not so bad in the winter, but the Rocky Mountains have to be crossed from Del Norte, which is 100 miles from the mines. After preparations are made, adequate shelter provided, etc., work can be carried on all winter. There are two districts—Las Animas and Lake—both in the same mineral belt. They comprise a Territory from 12 to 15 miles in width and 60 miles in length. All the locations made by the miners so far have been made on croppings, no blind leads having been searched for. The leads run from the foot of the mountains up to the top, and vary in width from a few inches up to 70 and even 80 feet in width. The ore is generally galena, interspersed with what the miners call gray copper, some of which assays over $3,000 to the ton.

At present there are no towns, nothing but a few scattered tents and log cabins, as usual in new districts. The men who went in there made a few locations, and then left for the winter. There is a small mill there called the Little Giant, with a Dodge crusher, which has a capacity of about five tons per day. There have been several thousand leads located during the summer, the owners of which intend returning in the spring to work them. All over that part of the country the people are much excited, and Mr. Newbill thinks there will be a great rush over there in the spring.

We inquired of him the expense of the trip there from this city, and he says it will cost $85 from here to Cheyenne; from Cheyenne to Denver, $10; Denver to Pueblo, $10. From Pueblo there is now a stage line, the fare on which will be from $5 to $8 to Del Norte. Or, if preferred, the prospector can procure *burros* or horses from Pueblo to Del Norte, a distance of 130 miles, with a good road all the way, and wood, water and grass in plenty. Del Norte is the proper place to outfit for the mines, as provisions, tools, etc., can be purchased there. From there to the mines the distance is 100 miles, with a good road to within 30 or 40 miles of the mines; from there the road is mountainous. Wagons have been running to the Little Giant mill during the summer, but the road is rough as yet. This wagon road is good to within 40 miles of the mines, and men are working every day on a toll road over the mountains. It took Mr. Newbill five days to get to Pueblo, and from there to the mines will consume about eight or ten days. This will make in all (say) about two weeks' trip. Provisions can be procured at Del Norte, and packed or hauled to the mines.

The summer there is quite pleasant, but somewhat showery. It is difficult to get into the country until well along in May, on account of the heavy snows on the road. The mines are in Baker's Park, and the Las Animas river heads in the district. The most natural way to get to the country is out by some place near Salt Lake City, the only objection to a route in that direction being the pressnes of Indians all the way from Fort Gunnison. Parties should not go that way at present on account of the Indians, but it will eventually be the route most traveled. The mines are only about 350 miles from Salt Lake, and a road in the direction indicated would save the circuitous route by rail.

Mr. Newbill brought with him a quantity of ore to be properly tested, some of which is in appearance very rich. He says the most peculiar thing in the district is the enormous size of the ledges and their number. He says the reports from there are exaggerated, but that the district is perfectly able to stand on its own merits without any puffing. Some of the large ledges—70 or 80 feet—contain ore assaying from $140 to $200 per ton, and plenty of it. The $8,000 ore he did not say anything about, but probably specimens could be found that would *assay* that much.

Among the principal mines of Las Animas District are the Green Mountain, Shenandoah, Mother Comstock, McGregor, Stephens, and Little Giant. The Green Mountain has a vein of mineral from three to five feet in thickness, and an assay of the ore made by Mr. Hemme, of this city, gave $242 and $2,693 per ton. It is owned by Messrs. Miles, T. Johnson, of Del Norte, D. Andrews, of Santa Fé, William Mulholland and Thomas Blair, of Animas District. The Shenandoah has a vein of ore three to five feet wide, which assays from $200 upwards, and is owned principally by Major Hamilton, of the Little Giant Co. The Mother Comstock has a large vein of mineral, which is said to assay well; it is owned by Robert Bell, F. S. Ketchum, J. W. Wallace, Wm. Cook and others. The Mandsfield is a very large lode, carrying mineral almost 70 feet in thickness, and is said to assay very high for galena ore. It is owned by Dr. Andrews and others. The McGregor is not so large as the above named mine, but the ore is very rich; owned by Robt. McGregor. The same will apply to the Stephens' lode, named after its owner.

The Little Giant is a gold lead, upon which has been done nearly all the work in the district, in the way of development. Besides the above named, hundreds of others that promise to be equally valuable have been located. Among these is one lately discovered by R. J. McNutt and George Howard, called the Poughkeepsie, which is said to assay from $1,900 to $2,800 per ton. Mr. J. L. Wightman, District Recorder, has some very large and apparently rich leads. Dr. James Berton, of Pueblo, also made some valuable locations. Messrs. Carley, Johnson & Co., at the mouth of Eureka Gulch, have a large number of mines which promise as much as any in the district, prominent among which are the Ohio, American Flag and Hamlet.

In the Lake District, which lies northeast of Las Animas, there are some very valuable mines, among them the Major, owned by Major J. Carey French, James Phillips, Fred. Simms, Peter Robinson, Mr. Shaw, of Del Norte, and Capt. Nugent, of Kansas. The Scotland and Mark mines are also considered good, and are owned by Peter Robinson, Fred. Simms, J. Phillips, Shaw, Capt. W. N. Green and Capt. Nugent. The Ule and Ulay are also good looking claims, with from three to five feet solid mineral, owned by Charles Goodwin, Mr. Mead and Mr. Hanson. There is a large field for prospecting, but none should attempt the trip during the winter.

Thanksgiving Proclamation.

State of California, Executive Department, Sacramento, November 6, 1873.

In conformity with a proclamation by the President of the United States, and in keeping with a custom sanctioned alike by time and propriety, I hereby appoint Thursday, November 27th, instant, Thanksgiving Day, and by virtue of authority of law declare it a legal holiday.

I earnestly request the people of the State to abstain, as far as practicable, from their ordinary business pursuits upon said day, and to devote it to family and friendly re-unions, to innocent recreations, to a generous remembrance of the poor and unfortunate, to the forgiveness of injuries and reconciliation with enemies, and to a grateful acknowledgment of blessings received from the Giver of all Good.

In testimony whereof I have hereunto set my hand and caused the great seal of the State to be affixed, at Sacramento, California, this 6th day of November, A. D. 1873.

[Seal] NEWTON BOOTH, Governor.

Attest: DRURY MELONE, Secretary of State.

IT is mentioned as a "festher in the cap of Southern industrial progress;" an encouraging sign of the times; an enterprise fruitful (in a double sense) of the best results, that the Rosebank Nurseries, near Nashville, Tenn., will disseminate this fall fully a million trees and plants, worth $75,000.

Explorer's, Miner's and Metallurgist's Companion.

The second edition of the above named work, by J. S. Phillips, M. E., has just been published and is now for sale by all booksellers, or can be had direct from the author. The book comprises a practical exposition of the various departments of geology, exploration, mining, engineering, assaying and metallurgy. It gives descriptions of geological formations of the primitive earth, its secondary rocks, its mineral veins, minerals, metals, coal fields, etc.; general composition and peculiarities of mineral veins; their comportment with each other and with cross courses, dikes and slides. Geological and mineralogical characteristics of the most extensive mining districts; exploration for, and examination of mineral veins; discrimination and assay of minerals by the most available and practical methods; mining and mechanical engineering above and below the surface, for dressing of ores, deep mining, etc.; assorting, crushing and concentration of ores. The best methods for reducing the minerals for market by roasting, milling, chloridizing, smelting and chemical treatment; the recurring errors in mining, etc.

The whole work has been revised and enlarged, and now comprises 672 pages, about 32 pages having been added. The appendix contains: the mining Laws of the United States; new methods for testing and assaying the base and precious metals; various useful tables of the weights, specific gravities and strength of materials, etc. The inferior engravings in the former edition have been replaced by better executed ones and a few new cuts have been added. Mr. Phillips is eminently a practical man and has had much experience in the business of which he writes. The first edition of the work met with ready sale, as will this one, no doubt. It has been very favorably spoken of by the leading journals of this coast, and those representing the mining industry in Europe. The book is neatly printed and substantially bound, and is a most comprehensive and valuable work of reference, fully justifying its title of "Explorer's, Miner's and Metallurgist's Companion."

Northern Coast Mines.

The Yakima and Swauk River mines are beginning to attract considerable attention. We publish in another column an article on these mines from the Portland *Bulletin*, which will give a good idea of the mines. The Walla Walla *Statesman* also describes the mines at length. We received from Mr. J. W. Fish this week a letter stating that he has assayed several lots of dust from these camps, coming from an area of 20 miles around. The gold runs from $12 up to $18 per ounce, and from his own knowledge of the country he feels confident that there is going to be a large and extensive camp established here.

Mr. Hurst of this city is prospecting in the Coeur D'Alene mountains, and we understand has struck some very rich rock. Another gentleman of Vancouver, W. T., is sinking a shaft on a galena vein, 50 miles north of Vancouver, which promises well. He is now down 30 feet and the vein is 12 inches in width. Assays from the mine give a yield of $55 per ton in silver and 70 per cent lead. Good news is daily expected from the Yakima and Swauk River. The Tacoma *Tribune* is informed that the mines there are deep, not surface diggings, as previously reported. There are about 350 claims located. Being in a grain and stock raising valley living is not high as compared with other mining regions. The diggings are 200 miles from Walla Walla and 65 from Yakima City. As the weather in that locality is mild it is thought that the miners can work all winter.

In addition to these mines dispatches from Victoria, states that the news of the recent discovery of rich gold fields in the Cassiar country is confirmed by the arrival of the "Californis" from Sitka and way ports; she brought down twelve miners and $15,000 in dust. One party is said to have taken ont $197 in 8 hours, working. The men who came down on the California intend returning early in the spring. Miners wintering on the Stickeen River have bought up all the provisions, so that a large supply will be required in the spring. Judging from the information from different sources there will probably be quite a profitable mining field opened up in these localities, but it is highly probable that the best ground is already located. There are plenty of men in the adjacent country to prospect and locate all the good ground, so it is not likely that miners from this State would make much by a trip up North.

The Miners' Association of Colorado.

A Miners' Association hae been formed in Colorado on an entirely new plan, and with objects so different from similar organizatione in this country, that it deserves more than a passing notico. The Association was formed at Denver, Colorado, within the past few weeks. It is not, however, sectional, bnt is to fally represent every portion of the Territory. They reqnest all those who feel an intorest iu the development of the mineral resources of Colorado, to co-operate with them iu their undertaking. The object of the Association, as stated in the circnlar sent to us, is, iu effect, to take proper steps to attract tho attention of capitalists to the Colorado mines. The mining interests are the paramount ones in that Territory, and mining is the basis of their wealth aud prosperity. The orgauization i. created to promote tho development of the mines and bring capital in contact with mining iudastry; to establish a cabinet representing the different minerals of Colorado; to register and record each lodo or mine so rocorded; to koep on file the different mining journals and a library of mining works for the use of miners, and to genorally establish and maintain an office as headqnarters for those intereested in mining; and also to take such steps ae may be necessary to represent and display the varied ores of Colorado at tho different fairs in the United States, especially at the fairs of the Colorado Indnstrial Association and the coming Centennial Exposition, to be held in the city of Philadelphia, in the year 1876.

The organization is called the Minere' Aesociatiou of Colorado and its principal office ie at Donver. Officere are to be elected annually. Any pereon intereeted in the development of the mining intereste of the Territory may become a member upon the annnal payment of $5, which ehall entitle him to free uee of the roome, to examiue all reports, booke, registers, maps or statietical data which may be obtained from time to time by the Associatiou. The management ie vested in a Board of Control, consieting of the Preeident, two Vice Preeidente, Mineralogist, Secretary and Treasurer. In order that the Asociatiou may obtain reliable and eatisfactory iuformation from the varioue mining dietricts of the Territory, aud, at the eame time furnish such mattere of intereet as will be valuable to the miners, the Board of Control appoiute annually an Advisory Board, consieting of one pereon (a member of the Association) iu each mining dietrict of the Territory, who are thereby couetituted agents of the Association in thoir locality, to collect minerale and information in roference to the minee of their section, and forward the eame to the Aesociation.

The Board of Coutrol ie to have the management of the affaire of the Association, and can make By-Lawe for ite government, not to conflict with the Articlee of Aesociation, or to promote any other interests than the ones intended in the organization. The Snperintendeut's duty ie to euperviee aud arrange the cabinet of ores; make arrangements for the traneportation of the eame; eee that euitable roome are provided, etc. The duty of the Mineralogiet is to make aesaye and examinations of oree, and eee that they are properly arranged and classified, etc. None of the officere are to receive any ealary, fee or reward, unleee the eame ehall be voted at an annnal meeting of the membere.

The plan of this organization ie a good one, if carried out ae expreeeed in tho circnlar. Of conree, some modifications will, however, be neceeeary. For inetance, while many persone might be fonnd who wonld eerve on the "Advisory Board" withont fese, the Snperiutendeut, Mineralogist and Secretary would, if they atteuded to their businese properly, reqnire some remnueration. Their dutiee would consnme most of their time, if the organization ever reached a permanent basie of any magnitude. The wholo plan really amounte to a method of advertieing the mining interests of Colorado, and ie one that might be followed with beuefit eleewhere. If they carry out the objecte proposed, and do not let any one set of men manage the thing in their own interests, it onght to henefit the working minere greatly.

The mining intereete of the conntry are not taken into coneideration nearly ae much ae they ehonld be. Information aud statistics ooncerning the mines are exceedingly meager. The Government, althongh very much exercised just now abont the coin produced from the mines, paye little attention to them ae a general thing and seems to think they will take care of themselves. It scatters broadcast voluminous reports on agriculture, natural enrlosities, like the Yellowstone conntry, railroad surveys, commerce aud navigation, etc., bnt precious little is printed abont the mines. True, there is a Mining Commissioner, with an appropriation sufficient to pay for printing circulars, which are sent to people, asking for gratuitous information, and which enables him personally to make a trip of about three months every year, but hie Annual Reports are never seen by any miners. Perhaps three thousand are printed aud then boxed up in Washington, where he has no coutrol over them and where they will lie uutil members of Congress choose to pay postage on them to their constituents. This particular matter ie referred to more at length in another columu.

As far as any matter of information is concerned in new practical methods of working ores, mechanical improvements in miuing machinery, methods of smelting, amalgamating, mining, hoisting, blastiug, drilling, timbering, roasting, hydraulicing, etc., the miuers are entirely dependent on the uewspapers for a knowledge of what is going on. If this associatiuu will keep a library of technical works on mining and kindred eubjects, and keep a file of all the papere likely to interest the members, they will benefit those men in their immediate vicinity. Of course the minere in isolated camps will derive ouly an indirect benefit by having attention called to their claims. A fine geological cabiuet could be collected by the proposed method at little expense and its exhibition at various placee would do much to attract attention to the localities from whence the specimens camo.

An attempt to make an exhibition of thie kiud wae made at the last Mechanice' Institute Fair in thie city, but owing to the lack of interest it would have been a failnre if Mr. Hanks and a few othore had not exhibited their private collectione. At that time ciroulare wore sent reqnesting minere to forward specimens, but as no eyetematic method of collecting them was made, the exhibition wae meager when we take iuto cone ideration the extent of mineral region on thie coaet. If the Colorado Minere' Aeociation carries out its plan honestly and makee a sncceee of it, no donbt similar organizatioue will be formed elsewhere.

The California Titmouse.

The architecture of the uest of the Califoruia Titmouse is a remarkable example of the ingenuity of birds in constructing their places of shelter. These birds are not commou in the Eastern States, though they are in Europe, but in California they are fouud in the timbered localitles on the coast, where the mountains are not high. There are several varieties, all distinguished for the beauty of their plumage. They are fond of densely wooded conntries and are extremely active; they can bo seen clinging to the branches and twigs in every conceivable positiou, and running around the large limbs with the agility of a monse, henco, perhaps their name.

They huild their uest in the shape of a sack, pendent from the limbs of treee in exceedingly inacceseible positions. They are composed of moeses and textile fibere filled in with bits of leaves that seem attached by a glutinous substance, the sidee of the sack being from a fonrth to a half inch thick and lined on the inside with a substance eoft as velvet. The only entrauce ie near the top, ae ie shown in our illustratiou. The engraving ie upon a scale of two-thirds the size of the specimen in our poeseeeion, but truthfully repreeents ite form.

NEST OF THE CALIFORNIA TITMOUSE.

The titmouee is known to lay from 8 to 12 eggs, and how ehe manages to inonbate and rear that number of yonng birde in euch a close, eack-ehaped neet and bring them all up ont of the same, introducing them to the outter world one at a time and jaet when they have strength enough to fly and eet them safely afloat every one for itself; and how lady titmonse, wholly untaught, can at the firet attempt construct her first domicil in all the perfection and beauty of a ekilled architect, are among the mysteriee that pertain to the untaught knowledge poseeeed by the lower animal creation everywhere, in contradistinction to that of primitive man, who hardly knows enough, untaught, to build the rudest hut.

What one Mine Does.—A good paying mine in a community ie a good thing, especially in "dull timee." The *Silver State* in epeaking of dull timee eaye: Unionville has no cause of complaint, eince one mining company—the Arizona—even with ite reduced force at the mine, dietributes monthly from $15,000 to $20,000 for labor at the minee and mille. Thie little item only showe the benefit accrning from the fact that a eiugle company of reepectable proportione will support a goodly sized town. The large amounte of mouey paid out by mining companiee for labor, in many of oar interior towne, hae the effect of making them prosperoue eettlemente, even whon timee are dull in the outeide world.

A Miners' inch of water ie abont twenty thousand gallons. The nsual price for an inch of water in the minee ie ten cents. The Spring Valley Company eells water in large quantities at eeventy-five cente per thousand gallone, or at fifteeu dollare and eeventy-five cents per inch—which ie one hnndred and fifty-eeven times the price which minere pay. Furnished in emall qnantitiee to honsekeepere, the company chargee from thirty to fifty dollars per inch—five hnudred timee the miner'e ratee.—*News Letter.*

Death of Seth Green.—The name of Seth Green in connection with fish cnlture ie known throughout the United Statee, and his untimely death by drowning ie much to be regretted. Mr. Green hae, for eome yeare past, devoted hie whole time and energies to the euccessful culture of fish, and the experiments conducted by him have done much to create the intereet now felt in thie enbject. He was an enthusiaet in piecicultare, and epared no paine in carrying on exteneive experimente in that direction. His death ie a national loss and it will be difficult to fill hieplace by another equally efficient.

A CURIOUS CASE.

The Eberhardt & Anrora Mill at White Pine ie to etart np next week, and ae no other mine or mill in that eection seeme likely to be run during the eeaeon, the *News* ie pleaeed to record the fact. The iron roofing for the mill hae arrived, and ie being put on the building, so that there can be no donbt that the mill will start ae intended. With 1,000 tone of ore at the mill and more being conetantly added, coneiderable bullion onght to be tnrned out.

Geanite Creek, Grant County, Oregon, ie the latest place up there where a promising quartz ledge hae been discovered. The aesaye run high.

Patents & Inventions.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., November 11th, 1873.

For Week Ending October 28th, 1873.*

Construction of Tunnels and Sewers.—Geo. Knoll, S. F., Cal.

Beer Drawing Attachment for Casks.—Samuel Marks, S. F., Cal.

Method of Laying Off Shoe Uppers.—Conrad Glanville, S. F., Cal.

Reissue.

Apparatus for Teaching Music.—Louis A. Seward, S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

A Curious Case.

We copy from the *Veterinarian* an engraving ehowing a remarkable caee of diseaeed skull of a horse, associated with prolonged life under great suffering. A correspondeut of that journal writes that he ie indebted to Mr. Mitchie of Sidney, iu whoee eurgery the specimen ie preserved, for the history of the case. The auimal is deecribed as being four years old when he broke loose; and as the teeth now denote him to be rising seven, it would appear that he lived nearly three yeare with his jawe imprisoned, ae it were, in the halter. It may be a matter of wonder to some that the horse ehould have lived so loug, but the owner accounte for this by their boing plenty of succulent grass and water where the skull wae found; and there is no doubt that so soon as the noose band of the halter had by continual preseure caueed exfoliatiou of the anterior portiou of the nasal bones (ae will be observed to be the case), the poor creature's life, by reaeon of hie jawe being capable of partial opening, wae prolonged. This, however, was not for long, as it ie quite evident from the etill fixed condition of the jaws, owing to the tightness of the rope, that death had resulted from etarvation, *i. e.*, incapability of opening the jaws to take food.

The owner of the horse wrote to Mr. Mitchie that in the year 1862 the horee wae roped, entirely wild, and when haltered he broke ont of the yard and got clean away with the halter on. The horse wae never again yarded, and in the year 1865 his remains were found on the top of a very high range, with the halter etill npon the head, which wae detached from the body, and nothing bnt bone left. The head wae carefully preeerved exactly ae it was picked up, with the same rope upon it. The side view of the skull which is given, illustratee all the points of iuterest. It ie very remarkable that the animal could have lived eo long nnder the circumstance.

The *Nevada Mining Review* ie the title of a newspaper publiehed in Virginia City, the first number of which hae reached ns. It ie to be devoted exclusively to the mining intereets, and will pay considerable attention to the etock market. The first number ie quite emall bnt ie neatly printed, and contains oonsiderable intereeting matter. J. D. Bethel & Co. are the publishers.

Now comes Humboldt county, in this State, with the claim that ehe has diamond fields in the vicinity of Boulder Creek, abont 30 miles from Eureka. We would like to see some of the Humboldt County folke offer diamond stock of California Street, where they would soon find out that potato raising paid better.

Miners and Mechanics will confer a favor oa each other, by writing ue occasionally on eubjecte of intereet to them in the eame business.

The Idaho placer minee are closing down and the miners are betaking themselves to winter quarters, as the streame are freezing np.

The Chinese miners are still working away at the claims below Oroville. They are buying np all the ground they can.

There are now no less than eight quicksilver claims heing developed in San Lnie Obispo county.

Montana ore ie arriving at Corriuue for shipment East.

Metalliferous Mines of Wales.

The mines of the Principality have heen worked with varying energy and succees from the very ealiest times, the minerals sought heing chiefly copper and lead. Since the great discoveriee at the Van Mine some few years back, there have been periodical rushes of investors to Welsh mining, and many lesser euccessee have to be recorded. Taking for the moment the county in which the mine is situated and the adjoining one (Montgomery and Cardigan) a great field of mineral wealth presente itself, which is heing hut very inadequately developed; hut it is impossihle bnt that capital will eventnally he turned, to some extent at least, in this direction, the more so now that Cornish mining is looking so depreesed, owing to the high price of coal, which hardly affects Wales, supplied as it is with an almost houndless water-power. It cannot be said that mining generally in the district just alluded to is in a very flourishing condition—a good deal, no donbt, due to the want of proper means of communication either hy roads or rail. This ought to he remedied. The Cornwall Minerals Railway is a specimen of what a mining district can do, though it is not to be suppoed that anything eo exteneive can be attempted in Wales, at any rate just at present, but landlorde ought to come forward and encourage narrow-guage linee, like the Festiniog, to he made through their hills and valleys; lines like this double and trehle the mere surface value of the land they pass through, and create their own traffic, and bring proeperity to all.

Much of the prejudice against Welch mining ie due to the recklessness of investors themeelvee. A few promising discoveries of lead are made; probahly the discoverere have no fnnde of their own to go further upon; it gets into the hands of speculators, and is hrought out at a large price as a company; there is no reserve of calle of money probahly to fall back upon, and after the little ready money the vendors have left the directors to spend is exhausted, the mine etope, and Welch miuing is condemned. If instead of thie a moderate price were paid where the chancee were undeveloped, and the public were told the real outlay necessary to make the property a paying one, some few might be deterred, hut they would not he the majority. The undulating nature of the surface in Wales, with its abrupt hille and valleys, renders it (when compared with a county like Cornwall) very inexpeusive for the diecovery of lodee of mineral, and in many cases tone aud tone of ore cau he taken away without any sinking at all; hut it should be horne in mind that this is not mining; it is as if the discoverer of the potato had contented himself with merely gathering the stalk, and yet how many minee have had their stalks and hlossoms plucked, whilst the real wealth lies hidden underneath.

How many miues in Cardigan or Montgomeryshire have heen sunk more than 50 fathoms deep? And, on the other hand, how many mines in Cornwall have turned out their mineral at all until that depth had heen attained, and there, too, most of the pumping has to be done hy steam? We have had huudreds of thousands of pounds inveeted in American mining, and with what result—when there are lucrative fields of mining enterprise at our very doors waiting for development. The principal mineral of the district of Cardigan and Montgomery ie lead, hut large quantitiee of copper are also fonnd; hut it ie not considered hy competent authorities that regular copper lodes exist in the clay-slate except in the vioinity of granite. Granite has not ae yet heen found in thie district, nor near it; whether or not it underlies the present formation, no one has ever ae yet gone deep enough to decide; lead, however, is found cropping up to the snrface throughout and contains in some instances as much as 50 ozs. of silver to the ton, hut as a rule from 10 to 20 ozs. is the produce. The price of lead is good, and likely to continue; and, with a fair discrimination on the part of investore, there is no reason why Welsh mining ehould not flourish, and prove a great eonrce of wealth to the whole country.—*London Mining Journal.*

Mining Discovery.—From J. W. Crawford, who visited Secret Cañon yesterday, we learn of an important mineral discovery in that portion of our highly favored district. It seems that Messrs. J. B. Osborne, E. J. Elzy and Geo. J. Gardner were impreased with the helief that there were good ledges undiscovered iu that locality. Accordingly on Tuesday morning last they put some men to work at a point just acroas the ravine from the justly celebrated Geddee & Bertrand. Within eix iuches of the surface a perfect foot-wall was diaclosed carrying splendid carbonate ore of extraordinary riohneee. Work has been indnstriously prosecuted for two days, aud last night a depth of eight feet had been reached. Au incline is heing carried down aeven feet in width, and eo far as prospected the ledge is known to exceed five feet in thicknesa. About ten tons of ore, estimated to he worth over $200 per ton, have already been deposited ou the dump. The lucky discoverers have locatod three claims of 1,500 feet eaoh to he known as the Oshorne aud Elzy series. Good judges are of the opiniou that the new diacovery will ere long eclipse the famous Geddes & Bertrand. It is certainly a very important discovery, and the gentlemen whose good fortune it was to make it are in every way deserving of such a eubstautial atreak of luck. They are among our moet enterprising and peraiatent mining men. We congratulate them on their "fiud."—*Ex.*

The Tecumseh Mining Company.

In the foothille of Calaveras county, two milee from Telegraph City and not more than twelve miles from Milton, the preeent terminue of the Stockton and Copperopolis Railroad, is situated the property of the Tecumseh Mining Company. Unostentatiously, without the blowing of horns, hut nevertheless with steady, untiring and never-failing confidence in their ultimate euccess, the management has continued the development of their mine, until now, at a depth of a little over 400 feet, they have come to a realization of their hopes in the ehape of stratified, gold-hearing quartz of a high grade. Their Superintendent, Mr. A. E. Kennedy, favorably known all over the State, and especially in Calaverae conuty, as one thoroughly understanding his bnsinese in all its branches, is of the opinion that, before a depth of 100 feet more is reached, he will he in an inexhaustible eupply of good milling ore. Their main shaft ie now down 420 feet. The rock through which it is sunk is composed entirely of porphyry, impregnsted with gold and silver-hearing sulphurets. The ore taken from the hottom of the shaft is eimilsr in character to that taken from the 308-foot level, hut of a higher grade, the sulphurets heing muoh coarser and containing a larger percentage of gold, and notwithstanding its being richly stained with silver sulphurets, ie gold-bearing in character and very easily worked. Two cross-cuts have been rnn in a southwesterly direction toward the hanging wall, the first 116 feet from the surface, being in 76 feet, and the second one, 308 feet from the surface, and having been run 118 feet to the west wall, both cross-cuts being suhstantially timbered, with an iron railroad track their entire length, and developing a great number of veins. Their main shaft ie one of the most substantially timbered in the State, 5 hy 15 feet, and is in three compartments, creating a splendid draft aud keeping the air at the hottom of the mine as fresh and sweet as on the surface. Their hoisting works are of the newest pattern, and the engine, hoiler and everythiug connected with it, are put up with a view to work the mine to a depth of 1,000 feet, without making any material alteratione. The Company have on their grounds a large dwelling for their Superintendent and his family, and run a hoarding-house, capable of accommodating any number of workmen. They have at this date a supply of firewood on hand that will last them for one year. A ten-stamp mill is on the gronnd, to which are to he added ten more stamps, and the management intends to put on their dnmp a good supply of milling ore during the winter, and start crushing in the spring, with every reasonahle hope of good returns to their stockholdere. In fact, it would he hard to fiud a mine in the county where the future prospects to the owners are hrighter, and where a more economical and busiuess-like management could be found, than that of the Tecumseh.

It is a wonder to us that more is not known of this most promising enterprise, unless the reason is found in the fact that all the stock of the Tecnmsch is held in large qnautities hy a few owners, who are more for the actual results of their lahors than for tho usual empty clap-traps of long-winded reports, so often resorted to by mine owners, iu order to give their property a fictitious value among etock-brokers and outsiders. For the credit of Calaveras county, as well as for the well-earned success of the Company, we hope that the Tecumseh mine will soon srrive at a full realization of all the expectations of its owuers.—*Calaveras Chron.*

The Coal Mines of Amador.

The editor of the Stockton *Independent* paid a visit to the coal mines in this county a few days ago, and speaks of them as follows:

The development of the Amador coal fields may be summed up as follows: The Lancha Plana miue, in the southern part of the county, is sufficiently developed to prove it a valuahle and extensive deposit. Coal in emall quantities has heen found in points between thie miue and the Ione mine, a distance of over ten miles, although no extensive deposit has as yet been fouud. The indications are, however, very favorahle, and there is little doubt that a more thorough examination of this region of territory will show that it is rich in this valuahle product. Near Ione City a mine has heen opened on the Arroyo Seco grant, owned hy Messrs. Bailey, Beagle, Hart and Goodman, which promiaes to he very extensive. This deposit is ahout fifty feet from the surface of the gronnd and the vein runa horizontally. An incline haa heen rnn into the hillside which taps the vein and a tunnel hae heen rnn therein a distance of one hundred feet on either side. The coal etratum is found to be from nine to eleven feet thick over the epace thus prospected, with no sign of au end of the deposit in either direction. In this mine there are ahout 10,000 tons of coal to every square acre of ground. Between this opening and Buckeye, aonthwest of Ione, the distance is ahout sevon miles, and the coal depoeit has heen struck at several placea between these two poiuts, while at Bnckeye a careful examination has heen made which shows that the deposit there extends over several hundred aores.

From the present development it ia apparent that the coal helt extends for nearly twenty miles, and that fuel efficient to supply the wants of the Stato for years to come can he thus procured at comparatively small cost. It must be admitted that the coal is not a first class artiole, yet a gentleman in Iono who has used it for the paet 11 years to oreate eteam to run a steam flonr mill, asserte that four tons of the coal will make ae much steam as five cords of the best wood he can purchase. This ehows that thie coal will be valuahle for msnufactories, as it can be delivered in this city, as soon as the railroad to Ione is constructed, at ratee much below the prices now charged for fuel now used for the creation of steam for manufacturing purpoees. Stockton is particnlarly interested in these developments, as there is a prospsct that railroad communication will soon be opened hetween this city and that valuahle regiou of country.

New Mill at Eberhardt.

By the courtesy of David Mitchell, Secretary of the Eberhardt & Anrora Company at Eberhardt, the White Pine *News* has inspected the premises and learned eomething of the future statue of the mill now heing huilt by this company. The site chosen is the one formerly occupied hy the hurned International, and through the kindness of Chief Engineer J. H. Montgomery and Master Millwright Perlia Rowell, the *News* gathered the following information regarding its dimensions and capacity: The length of the whole structure covering the working machinery is 154 feet; hreadth 145 feet; and the amount of material used in conetructing is 189,000 feet of lumher; 120,000 hrick; 1,100 perch of stone and 16,000 feet of No. 27 iron for roofing purposee. The dimensions of the different snbdivisions are: one dump, 20x62 feet, with a fall for ore from wagons of 9 feet, ore room, in rear of building, 20x62 feet; dry kiln, 56x16 feet; hattery room, 52x62 feet; pan room, 33x132 feet; engine room, 42x40 feet and boiler room, 42x52 feet. These dimensions have heen furnished ue hy the engineer and millwright, and we publish them to show the fact that the etructure has beeu huilt with a view to roominess and to afford facility in working. The machinery of the mill consists of eix tuhular hoilere, each 54 inches in dianeter and 16 feet long, with a capacity of 150 horse-power, set in hrick; one engine occupying a epace 20x42 and of 110 horse-power capacity; six hatteries of five stamps each, making 30 in all, with an average weight each of 733lbs; 16 pans, five feet in diameter; eight settlers, eight feet in diameter; four agitators, six feet in diameter; two cleaning up pans, four feet in diameter; one 9x16 Blake rock crusher; one 10x14 steam pump and four 14x48 inch retorts. There has heen placed in position 200 feet of line shafting, varying from 9 to 4¼ inches in diameter, and 72 feet from 4¼ to three iuchee. The capacity of the 30 stamps is 50 tons per day of 24 hours with dry crushing, and that of the settlsrs 72 tons. We give the above figures for the henefit of those iuterested in mattere pertaining to mills, aud are assured hy the gentlsman having charge of construction that, when finished, this will he the largest and most efficient 30-stamp mill in Nevada. When one reflects that under the supervision of Mesers. Montgomery and Rowell, who have conducted the actual work, that all the old, hent and apparently useless machinery, such ae engine, hoiler, shafting aud the like, has heen utilized and worked into this mill, it certainly is due them that credit should he given for their ability in the saving they have made the company. In consequence of the delay in furnishing material, the structure will not he completed within forty to sixty days from date. To Manager Frank Drake we extend our congratulatione that he has shown so good discrimination in the choice of his lieuteuants to perform the work laid out hy himself. We must not omit to mention that there are 1,000 tons of good ore now at the mill ready for a start, and teams are daily hanling more from the mines of the company ou Treasure Hill, thus giving a guarantee that the stamps will he kept in operation during the eutire Winter.

Mariposa Mill.—This mill, situated at the foot of Cedar Hill, on a branch of Seven Mile Canyon, is at present engaged in crushing ore from the Consolidated Virginia mine. The mill contains ten stamps, five amalgamating pans and two settlers. It is capable of reducing forty tons of ordinary ore per day, hnt owing to the extraordinary richness of the Consolidated ore, they work of it only ahout twenty-five tons. The ore ia paying $200 per ton, heing the richest ore now going to the milla from the Comstock lode. We paid a hasty visit to the mill day before yesterday, and found that by ita late overhauliug it has been made almost a new mill, aud a very snug and couvenient one at that. The mill is in charge of John Hereford, Superintendent of the mills of Fair, Mackey & Co. At the time of our visit they had in their retort a batch of about $8,000 in crude hullion. A great deal of the ore is so much decomposed that it does not require crushing. After being separated from that of a coarser nature, hy means of screens, it is at once placed in the pans for amalgama tion. It is said to he hetter to pnt it into the pane in thia shape than to first rnn it through the stamps, as, if made too fine (it heing so very rich), much eilver will not he amalgamated, aud will float away in the water. There is a considerable stook of ore on hand at the mill, with more coming daily, aud there ia also piled up at the mill a supply of wood sufficient to last about three months. Teams are daily adding to thia stock. A large roservoir has been constructed a short distance below the mill, in which to catch all the tailings flowing from it. Doubtlesa these tailings are very valuable.—*Enterprise.*

More Coal Discoveries.

The Sacramento *Union*, of Novembsr 1st, saye a coal bed hae been discovered on the land of W. E. Bryan, member elect to the assembly, near Michigan Bar, Sacramento county. It eeeme to he of the character termed "lignite." It ie softer and more hrittle than ordinary coal, and splits up into layere when it is expoeed to the air and dried. It is dnll black in color, aud has none of the bright gloee of the usual article of coal. Some of it wae tried in the furnaces at Horace Adams' foundry. It wae fonnd to burn very well, with a good blaze, and answered the purpose ae well as the fuel that customarily wae hurned in the foundry. It will keep np steam as well without the blower as with it. The existence of coal was accidentally diecovered in 1863, and the matter rested for a numher of years without any endeavor being made to gain more knowledge of it. Not long since a company determined to prospect the claim, and entered into an agreement that in a certain contingency Bryan should sell the land to them for a certain amount. The Company contracted with Laufkotter Bros., of Sacramento, to bore for the coal, and they made nine horings. A shaft was snnk to the coal, and the stratnm was found to be on an average from five to eight feet in thickness. There ie a bed of ssndstone about fifteen feet from the surface, and about twenty feet below this ie the coal. It is the opinion of several coal "sharpe" that the discoveries of that mineral that have been made at Lincoln, Placsr county, at Lancha Plana, Amador county, and in Yolo county, are all on the same lead, and that wherever the layer of sandstone is found there is coal underneath. At Lincoln, the existence of coal was first known in 1869, in horing an artesian well for a flouring mill. Piecee of the coal came up in the auger, and they were tested in a blacksmith's forge, and burned well. The matter was forgotten until a few months' ago, when a coal miner happened in the community, and hearing of the circumstance, made arrangements to proepect. He bored down to it and satisfied himself that the coal was good. A capitaliet who ownes the land determined to mine for it, and a shaft has heen sunk to the coal. It lies at a depth of fifty-five feet from the surface, and is of the same kind as that fouud in this county. Coal has heen taken from the mines at Lancha Plana for a year or two, and several quartz and a flouring mills use it as fuel. The mines in Yolo county are but recently discovered.

Quicksilver Suggestion.

The Gold Hill *News* eays: As ie well known, quicksilver is essential to the prodnction of gold and silver. Nature eeems to have beeu aware of that fact when gold was planted in the Sisrra Nevada mountaine, and accordingly placed parallel with the Sierra Nevada gold and silver hearing mountains the Coast Range, which contains the quicksilver. The two rangee hearing the different metals are placed convenient to each other, and it was the design, no doubt, that the Coast Range, with ite quicksilver, should suhserve the development of the gold and silver of the Sierra Nevada. Rscent explorations have shown that the Coast Range is very rich in quicksilver; that it contaiue more than enough for uee in gold and silver mining. Notwithstanding the plenty which ahounds, quicksilver ie high in price, and is going up every day. Its preeent price of $1.12¼ per pound is now a eerious drawhack to mining, all becauee it has fallen undsr the control of the monopolists of the State. They ask what they please for the neceesity and the minere are obliged to pay what is asked. It is very certain that the monopoliste will never lower their demands with anything like willingnese. Congrees will not help in thie matter hy aholishing the duty on foreign quicksilver, hecause Congress does not protect either through tsriff or patent lawe, the indnstriee or the producere of the country. The protection from that source goee to the monopoliats every time. But in the quicksilver affair, it eeems to us that miners might protect themeelvee. The gold and silver mining companies of California and Nevada, which have plenty of capital, might join together and work enough quicksilver minea to supply their own wants. Theee large companiee could own quicksilver mines and work them, as many of them now own and work wood ranchee to get a cheaper eupply of wood. For inatance the Idaho, Enreka, Empire and North Star minee of Grass Valley might combine and purchase one of thoae quicksilver minea recently diecovered, and work their purchased mine to get out their owu needed quicksilver. The Comstock lode mining companies could do the eame thing. At any rate there should he some eort of a combination of gold and silver minera to put down the preaent monopoly iu quicksilver.

Replacing a Severed Finger.—Mre. Mitchell, who lives ou Eigthteeuth atreet, near Miseion, met with a painful accident yeaterday. She was cutting hay in a hay-cutting machine when her left hand, hy some mischance, fell under the knife, which severed the index finger and badly lacerated the hand. Dr. J. S. Coleman was called in, and succeeded in replacing the finger, which givos every promise of being ae good as it ever was.

Miscellaneous.

Mineral Oils for Iron.

The use of heavy mineral oil as a preservative for iron is strongly recommended by the London *Oil Trade Review*, the snbstanee referred to being, we presume one of the products of shale distillation, so extensively practiced in Great Britain. Whether a similar prodnct can be obtained from our petrolenms ie a good subject for resoarch. Onr contemporary says: The action of the oil is two-fold. First, it is detergent when vigorously aud freely brnised over an already rnsted snrface. It seems to loosen the bulk of the rust and it darkens that which remains. Secondly, it acts as a varnish if applied after the cleansing has beeu effected, or to new and bright work. Its superiority to animal and vegetable oils depends upon the fact that the hulk of the oil evaporates, and it leavca only a very fine film hehiud. If the oil ia light and fully refined it evaporates so completely as to do bnt little good in this way; but if tinged or "once run" oil of sufficiently high gravity be nsed, tho resinous or carbonaceous matter which gives tho tinge to the oil remains behind and forms the protection film of varnish. Ordinary varnish leaves far too thick and obvious a film, while the film of the once run oil does its work of protection without displaying itself. As regards the density of the oil reqnired for this purpose, we recommend that which stands between the burning oil and good lubricating oil; it is known and sometimes sold as "intermediate oil." We are satisfied that a good trado may be done by anybody who will bring this before the public in a proper manner, and supply the article as required. For domestic purposes, for the cleaning of all kinds of household iron work, for the preservation of snch things as mowing machines and other garden tools, or exposed iron implements, the brown oil should be sold in small hottles at a cheap rate. For manufacturers of iron work and for iron mongers, to whom it will prove invaluable, it mnst of coursc be snpplied in larger parcels.

Willow Creek Mines.

The new district is in Beaverhead county, near the head of Willow Creek, which is a tribntary of the Big Hole, and is about eight miles from Vipond district, and has been named Bryant district. The Lady Elgin was the first lode discovered in the district, on Jnly 3d, 1873, by T. J. Grotevante and Joseph McCrary. Grotevante discovered the next lode, the Trapper, on August 6th, 1873. The Trapper is now owned by the Trapper Company, comprising Grotevaute, D. A. Parker, J. McCrary, J. A. Bryant, N. Sanders and Charles DeLorimer. These parties have been in Vipond district since its discovery, and this year have built an expensive wagon road from Divide Creek to Vipond district—eighteen miles. The Trapper is the richest lode known in the district. Fifteen feet of vein is exposed hy a cnt, and twenty tons of ore are now ont, worth, on an average, $400 per ton. The ore is black snlphurets, and has abont six per cent. copper and six per eent. lead. The Trapper Company has other lodes in the district. G. W. Stapleton and James McCammon own the Keokuk and Marc Antony lodes, both of which ehow well, and next year ore will be mined from the same and shipped. Owen Gaffney, James Moffatt and Maynard own several lodes in the district, one or two of which will prodnce ore that will pay to ship.—*Montanian.*

Worth Knowing.—One ponnd of green copperas, costing seven cents, dissolved in one quart of water, and poured down a water-closet, will effectually concentrate and destroy the fonlest smells. On board ships and steamboats, about hotels and other pnblic places, there is nothing so nice to pnrify the air. Simple green copperas, dissolved in anything nnder the bed, will render a hospital, or other places for the sick free from nnplessant smells. In fish-markets, slanghter-houses, sinks, and wherever there are offensive gases, dissolve copperas and sprinkle it abont, and in a few days the smell will pass away. If a cat, rat, or mouse dies about the house, and sends forth an offensive gas, place some disolved copperas in an open vessel near the place where the nuisance is, and it will purify the atmosphere.

A New Needle Gun.—The Vienna journals speak of a new needle gun by Dreyse, and which is said, with regard to simplicity and solidity of construction, especially of the different parts of the lock, is to be very mnch snperior to the Mauser rifle. It is stated that twenty-four shots per minnte can be fired with it. It appears, however, remarkable that although a considerable nnmber of new breach-loading rifles, snch as those of Werndl, Werder, Henry and Martini, have received the first prize, *i. e.*, the large medal, this Dreyse rifle has not even been honorably mentioned.

A new photo-process, announced by an English photographer, consists in censitizing gelatin by means of bromide of silver. The mixture ie applied warm to the glass plate, and the picture may be taken with the plate either wet or dry. The time of expoeure ie the same as for ordinary wet collodion plates. The alkaline pyro developer is nsed, the picture making its appearance rapidly, with any reqnired degree of intensity. This process, it is thought, promises to compete sharply with the ordinary collodion process.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveate filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copics of Patents and Assignments procured; Examinatione of Patents made here and at Washington; Examinations made of Assignments recorded in Washiugton; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Proscouted; Opiuions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various iuventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable invontions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale aud popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreigu conntries which grant Patents, including Great Britain, France, Belgium, Prussia, Anstria, Victoria, Peru, Rnssia, Spain, British India, Saxony, Brazil, Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, bnt the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country sooner than any other agents.

Home Counsel.

Our long experience in obtainiug patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previons applications which will interfcre with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mntual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circnlar and other printed illustratione, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable nse.

DEWEY & CO.,

United States and Foreign Patent Agents, pnblishers Mining and Scientific Prees and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Pubhshed or issued, wholesale and Retail, by DEWEY CO., Mining and Scientific Press Office, S. F.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It givee short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pagee, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an sutbor whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other publisbed, embracing tho subjecte treated. Its authority is highly esteemed and regarded by ite readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot bo found elsewhere in print. It alse abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contaiue 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As ite title indicates, thia work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstew, M. D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable ratce by Dewey & Co., Mining and Scientific Press Office, S. F.

New Incorporations.

This following companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

CHARIOT MILL AND MINING Co.—Nov. 7. Location: Bannor Mining District, San Diego County, California. Directors—James B. Lang, Duncan McLillan, Henry H. Johnston, Charles J. Pilsbury and John Jullan. Capital stock, $3,000,000, in shares of $100 sach.

VENTURA M. Co.—Nov. 8. Location: Stats of California. Directors—Maurice Dore, G. D. Roberts, S. Hay denfeldt, Jesse S. Wall and E. R. Burks. Capital stock, $12,000,000, in shares of $100 each.

NORTH BELMONT M. Co.—Nov. 8. Location: Philadelphia Mining District, Nys County, Nevada. Directors—A. K. P. Harmon, J. D. Fry, Robert Sherwood, E. R. Warsaw, H. O. Kibbis. Capital stock, $5,000,000, in shares of $100 sach.

PATTEN M. Co.—Nov. 10. Location: Gold Hill Mining District, Storsy County, Nevada. Directors — Hill Beachy, George M. Pinney, P. J. Kennedy, M. F.Truett, Jacob Smith. Capital stock, $5,000,000.

THE ALAMEDA WATER COMPANY.—Nov. 11. Ths corporation is formsd for ths purpose of supplying San Francisco and Oakland and othsr cities, towns and placss with frssh water for drinking and household purposss, for manufacturing, extinguishing firss and all other purposss for which frssh water is used by ths public, and to carry on ths businss of s watsr company gsnerally. Ths place of businss of the company is in San Francisco. Trustees—Faxon D. Atherton, Chas. N. Felton, San Mateo county; Maurice Dors, George Loomis and George T. Ives, San Francisco; Charles Hadsll, Alamsda. Capital stock, $5,000,000, in shares of $100 each.

SAN FRANCISCO PACKING AND PROVISION Co.—Nov. 12. Object: To carry on ths business of curing msats and importing, manufacturing, buying, sslling, trading and dsaling in provisions. Trustees—C. P. Hubbell, John B. Wooster, Albert F. Collins, Georgs H. Whsaton, John Stroufs, L. H. Sweeney and William H. Dietrich. Capital stock, $200,000.

The Most Popular Medicine Extant.

1840. Over 30 Years, 1873.

SINCE THE INTRODUCTION OF

PERRY DAVIS'

PAIN-KILLER,

And after thirty years' trial, the "PAIN-KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and none where it has not been largely and highly prized. Moreover, there is no climate to which it has not proved itself to be well adapted for the cure of considerable variety of diseases; it is admirably suited for every race. It has lost none of its good name by repeated trials, but continues to occupy a prominent poaition in every medicine chest; and is still receiving the most unqualified testimonials to its virtues from persons of the highest character and responsibility. Physicians of the first respectability recommend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, etc., but for Dysentery or Cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine. No article ever attained such unbounded popularity. As an external and internal medicine the Pain-Killer stands unrivalled.

Thirty Years are certainly a long enough time to prove the efficiency of any medicine, and that the PAIN-KILLER is deserving of all its proprietors claim for it, is amply proved by the unparalleled popularity it has attained. It is a SURE and EFFECTIVE remedy. It is sold in almost every country in the world, and is becoming more and more popular every year. Its healing properties have been fully tested, all over the world, and it needs only to be known to be prized. Be sure you buy none but the genuine, manufactured by PERRY DAVIS & SON, Providence, R. I.

Sold by all Druggists. nov8

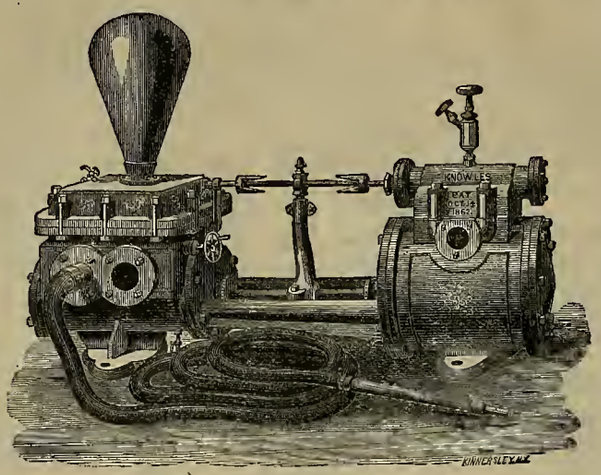
KNOWLES' PATENT STEAM PUMP.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., January 14, 1873.

A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a FIRST PREMIUM and Diploma, awarded to the Knowles Patent Steam Pump, as published in the Official List September 23d, 1871.

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents
WILL BE PROMPTLY PROSECUTED.
